| 26. Engine air cleaner.                                                | Install, refer to para 4-25D.                                                                                                                    |                                                                     |
| 27. Engine turbo air inlet.                                            | Install, refer to para 4-27C.                                                                                                                    |                                                                     |
| 28. 110 VAC power cord.                                                | Plug into curcuit breaker box receptacle and power source.                                                                                       |                                                                     |
| 29. Engine coolant heater circuit breaker.                             | Flip to ON and verify that heater (23) functions properly.                                                                                       | After check, flip circuit breaker to OFF and disconnect power cord. |
| 30. Vehicle batteries.                                                 | Reconnect, per para 5-37B.                                                                                                                       |                                                                     |
| 31. Engine.                                                            | Start up (refer to TM 9-2320-273-10) and check for leaks.                                                                                        |                                                                     |
| 32. Engine.                                                            | Shut down, refer to TM 9-2320-273-10.                                                                                                            |                                                                     |

## SENDING UNITS, SWITCHING DEVICES, AND WINTERIZATION KIT.

## 5-90. WINTERIZATION KIT ENGINE COOLANT HEATER MAINTENANCE (Continued).

TA 074852

SENDING UNITS, SWITCHING DEVICES, AND WINTERIZATION KIT.

5-91. WINTERIZATION KIT BATTERY BOX HEATER MAINTENANCE.

THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)

- a. Removal. (60)
  - b. Installation. (60)
  - c. Operational Check. (15)
- 135 Minutes Total.

INITIAL SETUP

APPLICABLE CONFIGURATIONS

All.

EQUIPMENT CONDITION

PARAGRAPH

5-38A.

CONDITION DESCRIPTION

Batteries Removed.

TEST EQUIPMENT

None.

SPECIAL TOOLS

None.

MATERIALS/PARTS (P/N)

None.

PERSONNEL REQUIRED

One (MOS-63B20).

SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Parked on Level ground.  
Battery Thermostat Must be Below 35°F  
for Actuation of Heater.

REFERENCES (TM)

| <b>A. REMOVAL (Continued).</b>            |                                                                                                                                                                                                                                                                                                                                                         |                                                                                 |
| 5. Insulation (12) and bottom cover (13). | a. Remove.<br>b. Clean surface with Milsolv (18).                                                                                                                                                                                                                                                                                                       |                                                                                 |
| <b>B. INSTALLATION</b>                    |                                                                                                                                                                                                                                                                                                                                                         |                                                                                 |
| 6. Insulation (12) and bottom cover (13). | a. Apply adhesive (22) to bottom cover (13).                                                                                                                                                                                                                                                                                                            | Adhesive (22) supplied with kit.                                                |
| 7. Insulation (19) and cover (17).        | a. Install insulation (19) in place.<br>b. Install cover (17).                                                                                                                                                                                                                                                                                          |                                                                                 |
| 8. Four seals (20) and (21).              | a. Apply adhesive (22) to seals.<br>b. Stick in place.                                                                                                                                                                                                                                                                                                  |                                                                                 |
| 9. Heater (3) and loom (6).               | a. Install four brackets (9) and tube clips (4).<br>b. Secure with four screws (5), lockwashers (10), and nuts (11).<br>c. Position heater (3) and loom (6) on bottom cover (13) and align four mounting holes.<br>d. Install four capscrews (14), washers (8) and nuts (7) and tighten.<br>e. Tighten four nuts (11), lockwashers (10) and screws (5). | Do not tighten nuts (11) at this time.                                          |
| 10. Cover assembly (1).                   | Install to bottom of battery box.                                                                                                                                                                                                                                                                                                                       | Position loom (6) so it is accessible after installation of cover assembly (1). |
| 11. Two terminals (2).                    | Connect to terminal strip.                                                                                                                                                                                                                                                                                                                              | Refer to para 5-92.                                                             |

## SENDING UNITS, SWITCHING DEVICES, AND WINTERIZATION KIT.

### 5-91. WINTERIZATION KIT BATTERY BOX HEATER MAINTENANCE (Continued).

| LOCATION/ITEM                                 | ACTION                                                                         | REMARKS                                                        |
|-----------------------------------------------|--------------------------------------------------------------------------------|----------------------------------------------------------------|
| <b>C. OPERATIONAL CHECK.</b>                  |                                                                                |                                                                |
| 2. 110 VAC power cord.                        | Plug into power source and vehicle receptacle. Flip battery heater circuit ON. |                                                                |
| 13. Heater (3).                               | Verify that heater (3) functions properly.                                     | Thermostat closes at 350F (1.7°C) and opens at 55°F ( 12.8°C). |

## SENDING UNITS, SWITCHING DEVICES, AND WINTERIZATION KIT.

**5-93. WINTERIZATION KIT BATTERY BOX INSULATION MAINTENANCE.****THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- a. Removal. (30)
- b. Cleaning. (45)
- c. Installation. (15)

90 Minutes Total.

**INITIAL SETUP****APPLICABLE CONFIGURATIONS**

All.

**EQUIPMENT CONDITION  
PARAGRAPH**

5-38A.

**CONDITION DESCRIPTION**

Batteries Removed.

**TEST EQUIPMENT**

None.

**SPECIAL TOOLS**

None.

**MATERIALS/PARTS (PIN)**

None.

**PERSONNEL REQUIRED**

One (MOS-63B20).

**REFERENCES (TM)**

TM 9-2320-273-10.  
TM 9-2320-273-20P.

**TROUBLESHOOTING REFERENCES**

None.

**SPECIAL ENVIRONMENTAL CONDITIONS**

Vehicle Parked on Level Ground.  
Battery Thermostat Must be Below 35°F  
for Actuation of Heater.

**GENERAL SAFETY INSTRUCTIONS**

Engine OFF.  
Transmission in Neutral.  
Park Brake Set.  
110 VAC Cable Disconnected From  
Power Source and Receptacle.  
All Breakers Set to OFF.

## CHAPTER 6

### TRANSMISSION MAINTENANCE

---

---

#### **6-1. OVERVIEW.**

This chapter provides you with the following information related to transmission maintenance:

- a. All required special tools and equipment.
- b. Other technical manuals.
- c. Troubleshooting procedures.
- d. Maintenance procedures.

---

#### **Section I REPAIR PARTS, SPECIAL TOOLS, TMDE, AND SUPPORT EQUIPMENT**

---

---

#### **6-2. COMMON TOOLS AND EQUIPMENT.**

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

---

#### **6-3. SPECIAL TOOLS, TMDE, AND SUPPORT EQUIPMENT.**

The special tools, TMDE and support equipment required for the transmission maintenance procedures described in this chapter are as follows: 0-150 psi (0-1-34 kPa) air pressure gage (refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustration).

---

#### **6-4. SPARES AND REPAIR PARTS.**

Spares and repair parts are listed and illustrated in the repair parts and special tools list covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

## Section II TROUBLESHOOTING

---

---

### 6-5. INTRODUCTION.

---

Troubleshooting procedures (table 6-1) are limited to those on-vehicle checks for which corrective actions are within the scope of Organizational Maintenance. Prior to starting any troubleshooting, the malfunction should be verified after the transmission has been warmed up to over 100° F (37.8°C) since a cold transmission can give faulty indications. To warm the transmission, run the engine for approximately 10 minutes with the transmission in NEUTRAL. The transmission will feel warm to the touch.

---

### 6-6. TEST EQUIPMENT.

---

An air pressure gage with a range of 0-150 psi (0-1034 kPa) is required to check for proper air pressure.

**Table 6-1. Transmission Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                       |                                                                                 |
|--------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                                                                                |                                                                                 |
| CORRECTIVE ACTION.                                                                                                 |                                                                                 |
| 1. SELECTOR LEVER CANNOT BE MOVED:                                                                                 |                                                                                 |
| Step 1. Inhibitor plate jammed with dirt.                                                                          | Remove cover, clean, and lubricate (Seg LO 9-2320-273-12).                      |
| Step 2. Inhibitor centering piston assembly out of alignment or damaged.                                           | Replace (Refer to Direct Support).                                              |
| Step 3. Bolts holding air control line to ratio selector too long or incorrectly torqued.                          | Tighten to 9 lb-ft ( 12 N•m), replace damaged components, or use shorter bolts. |
| Step 4. Bolts incorrectly installed when ratio selector assembled.                                                 | Check to see that bolts are not run in at an angle.                             |
| 2. ENGINE DOES NOT TURN DRIVESHAFT IN ANY SPEED FORWARD OR REVERSE:                                                |                                                                                 |
| Step 1. Check oil level in transmission.                                                                           | Add oil to correct level (see LO 9-2320-273-12).                                |
| Step 2. Check to see that air hand control valve on ratio selector is pushed in.                                   | Push in hand valve.                                                             |
| Step 3. Check to see that air pressure supply is available and adequate to transmission; 60-120 psi (414-827 kPa). | Troubleshoot compressed air system (para 9-5).                                  |
| Step 4. Inspect air control line and connectors between ratio selector and transmission.                           | Tighten to 18 lb-ft (24 N•m) or replace damaged components.                     |

*Table 6-1. Transmission Troubleshooting Procedures (Continued).*

| MALFUNCTION.                                                                    | TEST OR INSPECTION.                                                                                                             | CORRECTIVE ACTION.                                                                                                                                                                                                                  |
|---------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 2. ENGINE DOES NOT TURN DRIVESHAFT IN ANY SPEED FORWARD OR REVERSE (Continued): | Step 5. Check to see that air pressure is available at ratio selector from truck compressed air system.                         | <ul style="list-style-type: none"> <li>a. Troubleshoot compressed air system ( para 9-5).</li> <li>b. Refer to Direct Support Maintenance for troubleshooting.</li> </ul>                                                           |
| 3. ENGINE TURNS DRIVE SHAFT IN SOME GEARS BUT NOT OTHERS:                       | Step 1. Check to see that adequate compressed air is available from truck.                                                      | Troubleshoot compressed air system (para 9-5).                                                                                                                                                                                      |
|                                                                                 | Step 2. Check air control line and connections between ratio selector and transmission for tight connections, damage and leaks. | <ul style="list-style-type: none"> <li>a. Tighten to 18 lb-ft (24 N•m) or replace damaged components.</li> <li>b. Refer to Direct Support Maintenance for troubleshooting.</li> </ul>                                               |
| 4. ENGINE DOES NOT TURN POWER TAKEOFF IN NEUTRAL :                              |                                                                                                                                 | Perform same steps as in Malfunction 2.                                                                                                                                                                                             |
| 5. TRUCK MOVES WHEN ENGINE IS AT LOW IDLE AND TRANSMISSION IN GEAR :            | Step 1. Check engine low idle rpm (should be 580-620 rpm).                                                                      | Refer to Direct Support Maintenance for adjustment.                                                                                                                                                                                 |
|                                                                                 | Step 2. Check transmission operating temperature.                                                                               | Allow transmission temperature to reach 100°F (37.8°C) before putting truck in gear.                                                                                                                                                |
|                                                                                 | Step 3. Put selector lever in NEUTRAL and check engine rpm at low idle. Put selector lever in 4th gear and check engine rpm.    | <ul style="list-style-type: none"> <li>a. If engine rpm does not change, the problem is corrected.</li> <li>b. If engine rpm decreases, the input clutch may be warped. Refer to Direct Support Maintenance for repairs.</li> </ul> |

**Table 6-1. Transmission Troubleshooting Procedures (Continued).**

MALFUNCTION.

TEST OR INSPECTION.

CORRECTIVE ACTION.

6. TRANSMISSION HOUSING BREATHERS SHOW AN AIR LEAK AFTER THE SHIFT IS COMPLETE :

Refer to Direct Support Maintenance for troubleshooting.

7. TRANSMISSION FEELS LIKE IT IS ENGAGED, THEN NOT ENGAGED, THEN ENGAGED AGAIN – TRANSMISSION IS ALSO NOISY:

Refer to Direct Support Maintenance for troubleshooting.

8. TRANSMISSION HAS A DECREASE IN OIL LEVEL WITH AN INCREASE IN OIL IN THE ENGINE :

Step 1. Check for inoperative breathers.

Replace the breathers (para 6-9C and 6-9 D).

Step 2. Check engine crankshaft seal.

Refer to Direct Support Maintenance.

9. TRANSMISSION GEARS MAKE NOISE DURING A SHIFT:

Step 1. Check for correct oil level.

Add oil to correct level (refer to LO 9-2320-273-12).

Step 2. Check for oil leaks.

Refer problem to Direct Support Maintenance.

Step 3. Check for clogged oil pump suction screen.

Clean screen (para 6-9B).

**Table 6-1. Transmission Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                 | TEST OR INSPECTION.                                | CORRECTIVE ACTION.                                              |
|--------------------------------------------------------------|----------------------------------------------------|-----------------------------------------------------------------|
| 10. TRANSMISSION TEMPERATURE GAGE READINGS ABNORMALLY HIGH : | Step 1. Check for correct oil level.               | Add or remove oil to correct level (refer to LO 9-2320-273-12). |
|                                                              | Step 2. Check for oil leaks.                       | Refer problem to Direct Support Maintenance.                    |
|                                                              | Step 3. Check for clogged oil pump suction screen. | Clean screen (para 6-9 B).                                      |
|                                                              | Step 4. Check oil cooler fins for obstructions.    | Clean cooling fins.                                             |

---

## Section III MAINTENANCE PROCEDURES

---

---

### 6-7. INTRODUCTION.

---

This section provides you with Organizational Level maintenance procedures for the transmission. The scope of maintenance is limited to the work listed in the following summary of task procedures.

**6-8. TRANSMISSION MAINTENANCE TASK SUMMARY.****INITIAL SETUP****APPLICABLE CONFIGURATIONS**

All.

**TEST EQUIPMENT**

None.

**SPECIAL TOOLS**

None.

**EQUIPMENT CONDITION  
PARAGRAPH**

9-13A.

11-16A.

11-16E.

4-23A.

4-30A.

5-37A.

6-11A.

9-16A.

**CONDITION DESCRIPTION**

Air Reservoirs Drained.

Front Radiator Shell and  
Screen Removed.Brush Guard Removed  
(916 thru 920).

Fuel Tank Removed.

Ether Cylinder Removed.

Batteries Disconnected.

Floor Access Plate Removed.

Supply Air Reservoir Re-  
moval (M916 thru M920  
Only).**MATERIALS/PARTS (P/N)**

Dry Cleaning Solvent SD-2 (Refer to Appendix C).

Oil – 5.5 Gallons (Refer to Appendix C).

Case Breathers (12), (2520-01-077-2803).

Oil Funnel.

Container, 6 Gal Min.

Gaskets (2), 9N4010 (11083).

O-Ring, 3D2824 (11083).

Soap Solution.

Gaskets (2), 9N1507 (11083).

Loctite (242).

Masking Tape.

Marking Pen.

Cable Ties (8) SST4S (06383).

Liquid Teflon (Refer to Appendix C).

**SPECIAL ENVIRONMENTAL CONDITIONS**

Vehicle Parked on Level Ground.

**GENERAL SAFETY INSTRUCTIONS**

Engine Off.

Park Brake Set.

Transmission in Neutral.

**PERSONNEL REQUIRED**

One (MOS (63B20).

**TRANSMISSION.****6-9. OIL SERVICE.****THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- a. Draining Oil. (10)
- b. Cleaning or Replacement of Pump Screen. (15)
- c. Removal of Case Breather. ( 5 )
- d. Installation of New Case Breather. ( 5 )
- e. Replenishing Oil Supply. (10)
- f. Checking for Leaks. (10)

55 Minutes Total.

**INITIAL SETUP****APPLICABLE CONFIGURATIONS**

All.

**EQUIPMENT CONDITION****PARAGRAPH**

None.

**CONDITION DESCRIPTION**

None.

**TEST EQUIPMENT**

None

**SPECIAL TOOLS**

None.

**MATERIALS/PARTS (P/N)**

Nonflammable Cleaning Solvent SD-2 (Refer to Appendix C).

Oil, 5.5 gallons (21 Liters) (Refer to Appendix C);

OEA if Sub-Zero Use.

Case Breathers (12) (2520-01-077-2803).

Oil Funnel.

Container, 6 gal min.

Loctite (242).

Gaskets (2), 9N1507 (11083).

O-Ring, 3D2824 (11083).

**PERSONNEL REQUIRED**

One (MOS-63B20).

**SPECIAL ENVIRONMENTAL CONDITIONS**

Vehicle Parked on Level Ground.

- |                                   |                                                                                                                                                                                                     |                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------|
| 1. Dipstick (4).                  | Remove.                                                                                                                                                                                             |                                                                       |
| 2. Drain plug (6) and O-ring (7). | a. Unscrew and remove.<br>b. Throw away O-ring.<br>c. Allow oil to drain out.<br>d. Inspect magnetic base of plug.<br>e. Install new O-ring (7) on drain plug (6).<br>f. Screw in plug and tighten, | If there are large metal particles notify Direct Support Maintenance. |

**A-1. TAKING OIL SAMPLE FOR ANALYSIS****NOTE**

Before beginning this task check transmission oil level according to operator's manual (TM 9-2320-273-10).

Start engine (see TM 9-2320-273-10), warm vehicle to normal operating range and stop engine.

- |                   |                                                                                                                                                                                                                          |                                                                                                         |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| 1. Draincock (16) | a. Unscrew and loosen.<br><br>b. When completed with task 1., use the proper bottle and take oil sample from the transmission drain valve (see TB 43-0210).<br>c. Check oil level to insure proper level after sampling. | When taking a sample, first use a container to drain a small amount of oil to clean the valve assembly. |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|

## TRANSMISSION.

**6-9. OIL SERVICE (Continued).****LOCATION/ITEM****ACTION****REMARKS****B. CLEANING OR REPLACEMENT OF PUMP SCREEN.**

3. Eight capscrews (11) and washers ( 10).      Unscrew and remove.

4. Access cover (9) and gasket (8).      a. Remove.  
b. Discard gasket (8).

On the M916 thru M920 the left side access cover is blocked by the PTO, so you will have to use the right side cover.

**CAUTION**

Exercise care that when the pump screen is replaced, that it is properly latched. If not the screen will fall into the housing and may damage internal transmission parts.

5. Pump screen (12).      a. Slide off of suction tube (13) by grasping metal spring tab and pushing down slightly while pulling out.

b. Inspect magnets.

If there are large metal particles, notify Direct Support Maintenance.

c. Clean with dry cleaning solvent.

d. Dry with compressed air.

## TRANSMISSION.

| <b>A. REMOVAL (Continued).</b>                                                             |                                                                                 |                                                                                            |
| 2. Four nuts (15) and washers (16).                                                        | Unscrew and remove four wires from two heaters (7).                             | Wires are contained in harness (17). Tag for reassembly.                                   |
| 3. Two nuts (5) and washers (6).                                                           | Unscrew and remove bottom heater (7) and two washers (10) from two rods (14).   | Remove only the bottom heater at this time.                                                |
| 4. Top heater (7), two nuts (5), washers (6), rods (14), washers (10), and four nuts (11). | Remove as an assembly from transmission.                                        | After assembly has been removed, disassemble nuts, washers, and heater from rods.          |
| 5. Harness (17).                                                                           | Unplug from switch (13).                                                        | Tag for reassembly. One terminal from harness (17) will still be connected to switch (13). |
| 6. Two bolts (8) and washers (9).                                                          | Unscrew and remove harness (17), plate (12), and switch (13) from transmission. | Tag one terminal from harness (17) for reassembly.                                         |
| 7. Four cable ties (18).                                                                   | Cut and remove from harness (17).                                               | Discard.                                                                                   |

## CHAPTER 7

### POWER TRANSFER CASE MAINTENANCE

---

#### **7-1. OVERVIEW.**

---

This chapter provides you with the following information related to power transfer case maintenance:

- a. All required special tools and equipment.
  - b. Other technical manuals.
  - c. Troubleshooting procedures.
  - d. Maintenance procedures.
- 

#### **Section I REPAIR PARTS, SPECIAL TOOLS, TMDE, AND SUPPORT EQUIPMENT**

---

#### **7-2. COMMON TOOLS AND EQUIPMENT.**

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

#### **7-3. SPECIAL TOOLS, TMDE, AND SUPPORT EQUIPMENT.**

---

No special tools, TMDE and support equipment are required for the power transfer case maintenance procedures described in this chapter.

#### **7-4. SPARES AND REPAIR PARTS.**

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools List covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

#### **Section II TROUBLESHOOTING**

---

#### **7-5. INTRODUCTION.**

---

Troubleshooting procedures (table 7-1) are limited to those on-vehicle checks for which corrective actions are within the scope of Organizational Maintenance.

**Table 7-1. Power Transfer Case Troubleshooting Procedures.**

| <p>MALFUNCTION.</p> <p>TEST OR INSPECTION.</p> <p>CORRECTIVE ACTION.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

## Section III MAINTENANCE PROCEDURES

---

---

### 7-7. INTRODUCTION.

---

This section provides you with Organizational Level maintenance procedures for the power transfer case. The scope of work is limited to oil service and cooler system maintenance.

#### NOTE

Maintenance procedures for the differential lockup control valve are given in Chapter 9, Section III, paragraph 9-44.

**POWER TRANSFER CASE.**

**7-8. OIL SERVICE.**

**THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- a. Draining Oil. (15)
  - b. Replenishing Oil Supply. (15)
  - c. Checking for Leaks. (15)
- 45 Minutes Total.

**INITIAL SETUP**

**APPLICABLE CONFIGURATIONS**

M916 thru M920.

**TEST EQUIPMENT**

None.

**SPECIAL TOOLS**

None.

**MATERIALS/PARTS (P/N)**

Oil Funnel.  
Oil, 5 Qts (4.7 Liters) (Refer to Appendix C);  
OEA if Sub-zero Use.  
Container, 1.5 Gal (5.68 Liters).

**EQUIPMENT CONDITION

## POWER TRANSFER CASE.

### 7-9. COOLER SYSTEM MAINTENANCE.

#### THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)

- a. Removal. (20)
- b. Cleaning and Inspection. (15)
- c. Installation. (20)
- d. Operational Check. (10)

65 Minutes Total.

#### INITIAL SETUP

##### APPLICABLE CONFIGURATIONS

M916 and M920.

##### EQUIPMENT CONDITION PARAGRAPH

7-8A.

##### CONDITION DESCRIPTION

Powver Transfer Case Oil  
Drained.

##### TEST EQUIPMENT

None.

##### SPECIAL TOOLS

None.

##### MATERIALS/PARTS (P/N)

Gaskets 2, MA128-20004 (34623).  
Plugs.  
Liquid Teflon (Refer to Appendix C)  
Masking Tape.  
Marking Pen.  
Cable Ties 2, SST4S (06383).

##### PERSONNEL REQUIRED

One (MOS-63B20).

##### SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Parked on Level Ground,

##### REFERENCES

TM 9-2320-273-10.  
TM 9-2320-273-20P.  
LO 9-2320-273-12.

##### GENERAL SAFETY INSTRUCTIONS

Engine Off.  
Transmission in Neutral.  
Park Brake Set.

##### TROUBLESHOOTING REFERENCES

Table 7-1.

## POWER TRANSFER CASE.

## 7-9. COOLER SYSTEM MAINTENANCE (Continued).

## CHAPTER 8

### PROPELLER SHAFTS AND AXLE MAINTENANCE

---

---

#### 8-1. OVERVIEW.

---

This chapter provides you with the following information related to propeller shaft and axle maintenance:

- a. All required special tools and equipment.
  - b. Other technical manuals.
  - c. Troubleshooting procedures,
  - d. Maintenance procedures.
- 

#### Section I REPAIR PARTS, SPECIAL TOOLS, TMDE, AND SUPPORT EQUIPMENT

---

---

#### 8-2. COMMON TOOLS AND EQUIPMENT.

---

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

---

#### 8-3. SPECIAL TOOLS, TMDE AND SUPPORT EQUIPMENT.

---

The special tools, TMDE and support equipment required for the propeller shaft and axle procedures described in this chapter are as follows. (Refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustration.)

Oil filter strap wrench.

---

#### 8-4. SPARES AND REPAIR PARTS.

---

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools List covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

## Section II TROUBLESHOOTING

---

---

### 8-5. INTRODUCTION.

---

Tables 8-1 and 8-2 contain instructions for troubleshooting the propeller shafts and axles. The corrective actions describe how to fix the problem or refer to a procedure for fixing the problem. The tables are arranged by malfunctions in the following order:

**PROPELLER SHAFTS (table 8-1).** Excessive shaft noise or vibration.

**AXLES (table 8-2).**

- a.* Excessive backlash.
- b.* Continuous axle or wheel noise.
- c.* Lubricant leaking,
- d.* Excessive or uneven tire wear.

If you cannot locate a problem using these procedures, refer to the troubleshooting procedures for wheels, steering, and suspension (para 10-5).

**Table 8-1. Propeller Shafts Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |  |

| TEST OR INSPECTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |  |
| CORRECTIVE ACTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| <p>1. EXCESSIVE SHAFT NOISE OR VIBRATION:</p> <p>Step 1. Check torque of yoke bolts at universal joints.<br/>Torque bolts to 300 lb-ft (407 N•m).</p> <p>Step 2. Check torque of capscrews.<br/>Torque capscrews to 100 lb-ft (136 N•m).</p> <p>Step 3. Inspect propeller shafts and universal joints for evidence of damage or excessive wear.<br/>Replace worn or damaged components (para 8-11).</p> <p>Step 4. Check universal joints for adequate lubrication.<br/>Lubricate (para 8-11).</p> <p>Step 5. Check for proper shaft alinement, propeller shafts are properly phased when the cross and bearing in the yokes at each end of shaft are in the same place.<br/>Disassemble and aline as necessary (para 8-11).</p> <p style="text-align: center;"><b>NOTE</b></p> <p style="text-align: center;">Look for arrow marks on the propeller shaft and slip yoke. The arrows will point toward each other. if marks are not discernible, punch mark each member insuring reassembly in the same relative position.</p> <p>Step 6. Remove propeller shaft from vehicle. Check freedom of motion of splines by moving shaft from fully retracted to fully extended. If excessive force is required to retract or extend shaft, or it does not reach full travel, separate shaft halves and inspect splines for wear, damage, and lubrication.<br/>Replace shaft assembly if required (para 8-11).</p> |  |

**Table 8-2. Axles Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |

| TEST OR INSPECTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| CORRECTIVE ACTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| <p>1. EXCESSIVE BACKLASH:</p> <p>Step 1. Check all universal joints.</p> <p>Lubricate and replace as necessary (para 8-11).</p> <p>Step 2. Check drive axle capscrews on universal joints for tightness.</p> <p>Torque to 100-110 lb-ft (136-149 N•m) (para 8-11D). If the problem persists, notify Direct Maintenance Personnel.</p> <p>2. CONTINUOUS AXLE OR WHEEL NOISE:</p> <p>Step 1. Check lube level in axle housing.</p> <p>Fill axle housing to proper level (para 8-12 for front axle or 8-13 for rear axle).</p> <p>Step 2. Check lube pump cover (forward rear axle) for visible damage. Remove and check for clogged filter (M915 only).</p> <p>a. Replace filter as required (para 8-13).</p> <p>b. Refer problem to Direct Support Maintenance if internal pump damage is evident.</p> <p>Step 3. Check that brake shoes are not dragging. Check for overheating of brake drum. Jack wheel clear of ground. Use tanker bar to pry up under wheel to check for loose bearings. Any movement of wheels indicates loose bearings. With brakes released spin wheels to check for overly tight bearings. Wheel should spin freely and smoothly. Remove hub and drum to check condition of bearings.</p> <p>Adjust dragging brakes and clean, repack, or replace bearings as necessary (para 10-13 or 10-14, for front wheels, para 10-15 for rear wheels).</p> <p>Step 4. Visually inspect tires.</p> <p>Inflate tires to proper pressure or replace if necessary (refer to TM 9-2320-273-10).</p> <p>Step 5. Check wheel balance.</p> <p>Balance wheels, if necessary.</p> <p>3. LUBRICANT LEAKING:</p> <p>Step 1. Check all cover plate bolts for tightness.</p> |  |

| MALFUNCTION.                      |                                                                                                                                  |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.               |                                                                                                                                  |
| CORRECTIVE ACTION.                |                                                                                                                                  |
| LUBRICANT LEAKING (Continued):    |                                                                                                                                  |
|                                   | Tighten bolts or notify direct support personnel to reseal.                                                                      |
| Step 2.                           | Check breathers (driving axles) for obstruction or damage.                                                                       |
|                                   | Clean or replace as necessary.                                                                                                   |
| 4. EXCESSIVE OR UNEVEN TIRE WEAR: |                                                                                                                                  |
| Step 1.                           | Check wheel alinement (para 10-10 for front wheels).                                                                             |
|                                   | Adjust alinement.                                                                                                                |
| Step 2.                           | Check brake adjustment.                                                                                                          |
|                                   | Adjust brake if required (para 9-31 (M915), 9-32 (M916-M920) for front wheels or 9-33 (M915), 9-34 (M916-M920) for rear wheels). |
| Step 3.                           | Check cold tire pressure.                                                                                                        |
|                                   | Inflate to proper pressure (Refer to TM 9-2320-273-10).                                                                          |

### Section III MAINTENANCE PROCEDURES

---

#### **8-6. INTRODUCTION.**

This section provides you with Organizational Level maintenance procedures for the propeller shafts and axles. To find a specific maintenance procedure, see one of the following task summaries.

- a. Propeller Shafts (para 8-7).
- b. Front Axle (para 8-8).
- c. Rear Axle (para 8-9).
- d. Pusher Axle (para 8-10).

**8-7. PROPELLER SHAFTS MAINTENANCE TASK SUMMARY.****INITIAL SETUP****APPLICABLE CONFIGURATIONS**

All.

**EQUIPMENT CONDITION  
PARAGRAPH**

None.

**CONDITION DESCRIPTION**

None.

**TEST EQUIPMENT**

None.

**SPECIAL TOOLS**

None.

**MATERIALS/PARTS (P/N)**

GAA ( Refer to Appendix C).

Blocks.

Nonflammable Dry Cleaning Solvent SD-2 (Refer to Appendix C).

**PERSONNEL REQUIRED**

One (MOS-63B20).

|                                                                                                                                                                                                     | 1        | A                                                 | Prop shaft from forward rear axle to rear rear axle.               |         |
| NOTE                                                                                                                                                                                                |          |                                                   |                                                                    |         |
| Before disassembly of any prop shafts and U-joints, punch mark each shaft and joint to insure proper assembly alinement. If already punch marked, do not make new marks, but use existing ones.     |          |                                                   |                                                                    |         |
| NOTE                                                                                                                                                                                                |          |                                                   |                                                                    |         |
| Before disassembly, use a suitable jack or sling to support shaft. It may be necessary to jack up rear differential with Park Brake OFF to release torque pressure on prop shaft/joint connections. |          |                                                   |                                                                    |         |

| <div><p>The diagram shows a rectangular panel (3) with a pressure gage (1) mounted on the left. A bulb/lamp assembly (4) is on the right. Two air lines (5 and 6) enter from the bottom right, passing through fittings (7) and elbow (8) to connect to the gage. Nuts (9) are used to secure the connections. Brackets (10) are used to support the gage and the air line connections. A screw (2) is shown at the top left corner of the panel.</p></div> <div><p>LEGEND:</p><ul style="list-style-type: none"><li>1. GAGE</li><li>2. SCREW (4)</li><li>3. PANEL</li><li>4. ## CHAPTER 9

### COMPRESSED AIR AND BRAKE SYSTEMS

---

---

#### **9-1. OVERVIEW.**

---

This chapter provides you with the following information related to compressed air and brake maintenance:

- a. All required special tools and equipment.
  - b. Other technical manuals.
  - c. Troubleshooting procedures.
  - d. Maintenance procedures.
- 

---

#### **Section I REPAIR PARTS, SPECIAL TOOLS, TMDE AND SUPPORT EQUIPMENT**

---

#### **9-2. COMMON TOOLS AND EQUIPMENT.**

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

---

#### **9-3. SPECIAL TOOLS, TMDE, SUPPORT EQUIPMENT.**

---

The special tools, TMDE and support equipment required for the compressed air and brake maintenance procedures described in this chapter are limited to the following items. (Refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustration.)

- a. Air Pressure Gage (0-200 psi min).
- b. Brake spring pliers.
- c. Wheel dolly jacks, and blocks.
- d. Oil filter strap wrench.

#### **9-4. SPARES AND REPAIR PARTS.**

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools list covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

## Section II TROUBLESHOOTING

---

### 9-5. INTRODUCTION.

*a. General.* The primary use of the compressed air system is to operate the service and park/emergency vehicle brakes. Other uses of compressed air are for transmission shifting control, air horn operation, windshield wiper and washer operation, the differential lockout, and on some vehicles, pusher axle controls, and front wheel drive. Air system component location illustrations for each truck model are contained in paragraphs 9-5e thru 9-5j. These same illustrations are contained in paragraphs 2-65 thru 2-70 and the components are further described in paragraph 2-64.

*b. Scope.* This section contains troubleshooting instructions based on observed malfunctions starting with generalized pressure problems and continuing to more specific malfunctions of components and compressed air functions.

*c. Test Equipment:* Air pressure gage (0-200 psi min).

*d. Troubleshooting.* Troubleshooting procedures are given in table 9-1. The procedures are grouped under the malfunctions listed below. Perform only those steps in a procedure required to remedy the malfunction.

1. Insufficient air pressure (Malfunction No. 1).
2. Excessive system pressure indicated (Malfunction No. 2).
3. Park brakes will not release (Malfunction No. 3).
4. Trailer or towed vehicle brakes will not release (Malfunction No. 4).
5. Service brake will not release (one wheel only) (Malfunction No. 5).
6. Service brakes will not apply (Malfunction No. 6).
7. No service brakes on trailer or towed vehicle only (Malfunction No. 7).
8. Trailer hand control will not apply trailer service brakes (Malfunction No. 8).
9. Park brakes will not apply (Malfunction No. 9).
10. Service brakes are weak or slow responding (all wheels) (Malfunction No. 10).
11. Front service brakes are weak or slow responding (Malfunction No. 11).
12. Rear service brakes are uneven or erratic (Malfunction No. 12).
13. Service brakes are uneven or erratic on one or more wheels (Malfunction No. 13).
14. Brakes overheat (Malfunction No. 14).
15. Stop lamps do not operate, brakes function normally (Malfunction No. 15).
16. Pressure gage(s) not indicating or is not accurate, brakes normal (Malfunction No. 16).
17. Air horn does not operate (Malfunction No. 17).
18. Windshield wipers or washers are inoperative (Malfunction No. 18).
19. Interaxle differential lockup inoperative (Malfunction No. 19).

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |  |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--|
| TEST OR INSPECTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |  |
| CORRECTIVE ACTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |  |
| <p>1. INSUFFICIENT AIR PRESSURE:</p> <p>Step 1. Check for air exhausting through open or damaged air reservoir drain valves.</p> <p style="padding-left: 40px;">a. Close or replace manual drain valve (para 9-13).</p> <p style="padding-left: 40px;">b. Replace automatic drain valve on supply reservoir (para 9-12).</p> <p>Step 2. Check for loose air connections between the compressor, governor, and air reservoirs.</p> <p style="padding-left: 40px;">Tighten any loose air connections and replace damaged components.</p> <p>Step 3. Check governor for proper operation and adjustment. Should be set to control pressure in supply reservoir at 105-125 psi (724-862 kPa).</p> <p style="padding-left: 40px;">Refer problem to Direct Support Maintenance.</p> <p>Step 4. With the engine not running, loosen the compressor output line at the compressor and listen for escaping air.</p> <p style="padding-left: 40px;">a. If air escapes continuously, replace the check valve in that line at the supply reservoir (para 9-15).</p> <p style="padding-left: 40px;">b. If the check valve is okay, refer problem to Direct Support Maintenance.</p> <p>Step 5. Check air line connections for tightness and air lines for cracks or breaks.</p> <p style="padding-left: 40px;">Tighten or replace connections and lines as necessary.</p> |  |
| <p>2. EXCESSIVE SYSTEM PRESSURE INDICATED:</p> <p>Step 1. Check for inoperative pressure safety relief valve on the supply reservoir.</p> <p style="padding-left: 40px;">Replace the safety release valve (para 9-14) only if reservoir exceeds 150 psi.</p> <p>Step 2. Check governor for proper operation.</p> <p style="padding-left: 40px;">Refer problem to Direct Support Maintenance.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |  |
| <p>3. PARK BRAKES WILL NOT RELEASE:</p> <p>Step 1. Check reservoir pressure gage and verify LOW PRESSURE warning lamp is out.</p> <p style="padding-left: 40px;">See Malfunction 1.</p> <p>Step 2. Verify PARK BRAKE manual valve is closed.</p> <p style="padding-left: 40px;">Close valve; if valve will not close, refer to para 9-19.</p> <p>Step 3. Check air lines for leakage or damage. Use a soap solution to check for leakage at connections and watch for bubbles.</p> <p style="padding-left: 40px;">Replace damaged lines and tighten loose connections (para 9-36).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |  |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                                                                                                                                                                                                                                                  | TEST OR INSPECTION. | CORRECTIVE ACTION. |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|--------------------|
| 3. PARK BRAKES WILL NOT RELEASE (Continued):                                                                                                                                                                                                                                                  |                     |                    |
| Step 4. (M915, M916 and M920 only). Inspect intervehicle air hoses for proper connections.<br>Connect hoses properly.                                                                                                                                                                         |                     |                    |
| Step 5. Check the air line between the two rear quick-release valves for damage or leaks using a soap solution. <ul style="list-style-type: none"> <li>a. Replace the line if damaged and tighten connections.</li> <li>b. Replace the park brake quick-release valve (para 9-22).</li> </ul> |                     |                    |
| 4. TRAILER OR TOWED VEHICLE BRAKES WILL NOT RELEASE:                                                                                                                                                                                                                                          |                     |                    |
| Step 1. Check intervehicle air hoses for proper connections. Close the trailer supply valve and disconnect the hoses.<br>Reconnect the hoses and open the supply valve.                                                                                                                       |                     |                    |
| Step 2. Check for trailer air leaks or defective brakes.<br>Troubleshoot trailer.                                                                                                                                                                                                             |                     |                    |
| 5. SERVICE BRAKES WILL NOT RELEASE (ONE WHEEL ONLY) :                                                                                                                                                                                                                                         |                     |                    |
| Troubleshoot brake.<br>Refer to brake malfunctions 3 and 4, above.                                                                                                                                                                                                                            |                     |                    |
| 6. SERVICE BRAKES WILL NOT APPLY:                                                                                                                                                                                                                                                             |                     |                    |
| Step 1. Check the pressure gages in the cab.<br>Operate the engine to build up proper pressure.                                                                                                                                                                                               |                     |                    |
| Step 2. Check position of park brake and trailer supply valves.<br>Position correctly.                                                                                                                                                                                                        |                     |                    |
| Step 3. (M915, M916 and M920 only). Check intervehicle connections.<br>Connect air hoses correctly and open trailer supply valve.                                                                                                                                                             |                     |                    |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                   |                                                                                                                                              |
|----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                            |                                                                                                                                              |
| CORRECTIVE ACTION.                                             |                                                                                                                                              |
| 6. SERVICE BRAKES WILL NOT APPLY (Continued):                  |                                                                                                                                              |
| Step 4.                                                        | Check for leakage at the brake pedal valve using a soap solution.<br>Tighten connections or replace defective brake pedal valve (para 9-21). |
| Step 5.                                                        | Check brakes for proper adjustment and worn linings.<br>Adjust brakes (para 9-31, 9-32, 9-33, 9-34).                                         |
| 7. NO SERVICE BRAKES ON TRAILER OR TOWED VEHICLE ONLY:         |                                                                                                                                              |
| Step 1.                                                        | Check service air hose connection and position of trailer supply valve.<br>Reconnect hose properly and open trailer supply valve.            |
| Step 2.                                                        | Check trailer supply valve for damage or leakage using a soap solution.<br>Replace defective valve (para 9-17).                              |
| Step 3.                                                        | Check the double-check valve(s) for damage or leakage using a soap solution.<br>Replace defective valve (para 9-27).                         |
| Step 4.                                                        | Check tractor protection valve for damage or corrosion.<br>If valve is defective, replace defective valve.                                   |
| 8. TRAILER HAND CONTROL WILL NOT APPLY TRAILER SERVICE BRAKES: |                                                                                                                                              |
| Step 1.                                                        | Check air lines between trailer hand control and double check valve for leakage using a soap solution.<br>Repair leaks.                      |
| Step 2.                                                        | Check tractor protection valve for damage or leaks using a soap solution.<br>Tighten connections or replace valve (para 9-26).               |
| Step 3.                                                        | Check the double-check valve for damage or leaks using a soap solution.<br>Tighten connections or replace valve (para 9-27).                 |
| 9. PARK BRAKES WILL NOT APPLY:                                 |                                                                                                                                              |
| Step 1.                                                        | Inspect vent on the park brake valve for damage or clogging.<br>Clean vent or replace valve (para 9-19).                                     |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                 | TEST OR INSPECTION.                                                                                              | CORRECTIVE ACTION.                                                |
|--------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| 9. PARK BRAKES WILL NOT APPLY (Continued):                   |                                                                                                                  |                                                                   |
| Step 2.                                                      | Check air chambers for proper position of caging bolt.                                                           | Adjust caging bolt (Para 9-37).                                   |
| 10. SERVICE BRAKES ARE WEAK OR SLOW RESPONDING (ALL WHEELS): |                                                                                                                  |                                                                   |
| Step 1.                                                      | Check for low reservoir pressure. Pressure should not be below 80 lbs. (Buzzer sounds at 80 lbs).                | See Malfunction 1.                                                |
| Step 2.                                                      | Check service air lines for damage and leakage using a soap solution.                                            | Tighten loose connections and replace damaged lines.              |
| Step 3.                                                      | Check brake linings and adjustment (para 9-31, 9-32, 9-33, 9-34, 9-35).                                          | Replace brake linings and/or adjust as necessary.                 |
| 11. FRONT SERVICE BRAKES ARE WEAK OR SLOW RESPONDING:        |                                                                                                                  |                                                                   |
| Step 1.                                                      | Check air lines between brake pedal valve and front brake chambers for damage and leakage using a soap solution. | Tighten loose connections and replace damaged lines.              |
| Step 2.                                                      | Check the limiting valve for damage and leakage using a soap solution.                                           | Replace defective limiting valve (para 9-25).                     |
| Step 3.                                                      | Check the brake pedal valve for damage and leakage using a soap solution.                                        | Replace defective valve (para 9-21).                              |
| Step 4.                                                      | Check front brakes for worn linings (shoes) and proper adjustment.                                               | Adjust brakes and replace linings if necessary (para 9-31, 9-32). |
| 12. REAR SERVICE BRAKES ARE UNEVEN OR ERRATIC:               |                                                                                                                  |                                                                   |
| Step 1.                                                      | Check for leakage in air lines between service brake relay valve and wheel air chambers using a soap solution.   | Tighten loose connections or replace defective components.        |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                           |                                                                                                                                                                                                                              |
|------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                                    |                                                                                                                                                                                                                              |
| CORRECTIVE ACTION.                                                     |                                                                                                                                                                                                                              |
| <b>12. REAR SERVICE BRAKES ARE UNEVEN OR ERRATIC (Continued):</b>      |                                                                                                                                                                                                                              |
| Step 2.                                                                | Check for air leakage between the air reservoir and the rear service brake relay valve.<br>Tighten loose connections or replace damaged line.                                                                                |
| Step 3.                                                                | Leak test rear brake part of the brake pedal valve.<br>Tighten loose connections or replace pedal valve (para 9-21).                                                                                                         |
| Step 4.                                                                | Check brake shoes for proper adjustment.<br>Adjust brake shoes (para 9-39).                                                                                                                                                  |
| <b>13. SERVICE BRAKES ARE UNEVEN OR ERRATIC ON ONE OR MORE WHEELS:</b> |                                                                                                                                                                                                                              |
| Step 1.                                                                | Have an assistant press and hold the brake pedal valve down and perform leakage test on air lines at affected wheels using a soap solution.<br>Tighten loose connections, repair or replace damaged air lines or hoses.      |
| Step 2.                                                                | Loosen line fitting at affected wheel air chamber and have an assistant lightly depress the treadle valve, Listen for air exhausting from line. No air indicates a clogged line.<br>Replace damaged or clogged line.         |
| Step 3.                                                                | Check brake adjustment (para 9-31,9-32, 9-39):<br>a. Adjust brake and schedule for maintenance as soon as possible.<br>b. If manual adjustment does not correct the problem, refer problem to Direct Support Maintenance.    |
| Step 4.                                                                | Press brake pedal down and listen for air leakage around wheel air chamber clamp.<br>Tighten clamp or replace ruptured chamber diaphragm (para 9-36 for front brakes, para 9-37 for rear brakes).                            |
| Step 5.                                                                | Remove hub and drum assembly to inspect plunger and adjuster mechanism and brake return springs (para 9-31 and 9-32 for front brakes, para 9-33 and 9-34 for rear brakes).<br>Clean, repair or replace defective components. |
| Step 6.                                                                | Check the brake linings for grease, glazing and proper installation (para 9-31 and 9-32 for front brakes, para 9-33 and 9-34 for rear brakes).<br>Clean, replace, or reinstall as required.                                  |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| <b>14. BRAKES OVERHEAT:</b>                                     |                                                                                                                                                                        |                                                                                                                                                                                                                            |
| Step 1.                                                         | Check for low reservoir pressure.                                                                                                                                      | If below 80 psi, see Malfunction 1.                                                                                                                                                                                        |
| Step 2.                                                         | Check for damaged or leaking front limiting valve or rear relay valves.                                                                                                | Tighten loose connections or replace defective valve (para 9-24 or 9-25, as applicable).                                                                                                                                   |
| Step 3.                                                         | Pull hub and drum assembly (para 10-13 through 10-15 as applicable) and inspect brake assembly. Apply brakes lightly and observe shoe movement for smooth operation.   | <ul style="list-style-type: none"> <li>a. Replace weak or broken return springs (para 9-31 and 9-32 for front brakes, 9-33 and 9-34 for rear brakes).</li> <li>b. Clean, service, and assemble brake mechanism.</li> </ul> |
| Step 4.                                                         | Check for insufficient lining to drum clearance (para 9-31 and 9-32 for front brakes, para 9-33 and 9-34 for rear brakes).                                             | <ul style="list-style-type: none"> <li>a. Adjust.</li> <li>b. If adjusting fails, refer problem to Direct Support Maintenance.</li> </ul>                                                                                  |
| Step 5.                                                         | Inspect wheel bearings for damage and proper lubrication.                                                                                                              | Adjust, lube, or replace bearings (para 10-13 through para 10-15 as applicable).                                                                                                                                           |
| <b>15. STOP LAMPS DO NOT OPERATE, BRAKES FUNCTION NORMALLY:</b> |                                                                                                                                                                        |                                                                                                                                                                                                                            |
| Step 1.                                                         | Have an assistant step on the brake pedal (with ignition key switch on) and check for approximately 12 volts dc at both electrical connections on the stoplamp switch. | If voltage is not present on both terminals, replace the double-check valve/stop lamp switch (para 9-28 or 9-29),                                                                                                          |
| Step 2.                                                         | Check for defective wiring or electrical connectors.                                                                                                                   | Troubleshoot the electrical system (para 5-17).                                                                                                                                                                            |

**Table 9-1. Compressed Air and Brake System Troubleshooting Procedures (Continued).**

| MALFUNCTION .                                                                 | TEST OR INSPECTION .                                                                                                                                                                                                                          | CORRECTIVE ACTION .                         |
|-------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------|
| <b>16. PRESSURE GAGE(S) NOT INDICATING OR IS NOT ACCURATE, BRAKES NORMAL:</b> |                                                                                                                                                                                                                                               |                                             |
|                                                                               | Step 1. Disconnect affected air line(s) at gage(s) and press the brake pedal. If no air exhausts, the line is clogged or broken.                                                                                                              | Replace defective line or gage (para 9-20). |
| <b>17. AIR HORN DOES NOT OPERATE:</b>                                         |                                                                                                                                                                                                                                               |                                             |

## Section III MAINTENANCE PROCEDURES

---

### 9-8. INTRODUCTION.

This section provides you with Organizational Level maintenance procedures for the compressed air and brake systems. To find a specific maintenance procedure, see one of the following task summaries.

- a. Compressed Air System (para 9-7).
- b. Brake System (para 9-8).
- c. Auxiliary Air-Powered Component Systems (para 9-9).

**9-7. COMPRESSED AIR SYSTEM MAINTENANCE TASK SUMMARY.****INITIAL SETUP****EQUIPMENT CONDITION****APPLICABLE CONFIGURATIONS PARAGRAPH****CONDITION DESCRIPTION**

All.

9-13A.

Air Reservoirs Drained.

**MATERIALS/PARTS (P/N)**

Gasket (5330-00-755-71 91).  
 Soap Solution.  
 Silicone Sealant (Refer to Appendix C).  
 Controllable Shop Air Supply.  
 Non Flammable Cleaning Solvent SD-2 (Refer to Appendix C).  
 Tape, Antiseizing Item 14, Appendix C.  
 Check Valve, 275756 (06853).  
 Air Pressure Gage.  
 Marking Pen.  
 Masking Tape.

**SPECIAL ENVIRONMENTAL CONDITIONS**

Vehicle Parked on Level Ground.  
 Work in Well Ventilated Area Away From  
 Sparks and Flames.

**GENERAL SAFETY INSTRUCTIONS**

Engine Off.  
 Transmission in Neutral.  
 Park Brake Set.

|---------------|--------|---------|

**A. REMOVAL.**

- |                              |                                                                    |  |
|------------------------------|--------------------------------------------------------------------|--|
| 1. Air dryer assembly (1).   | Unscrew and remove hoses (3) and (11) and tubing (2).              |  |
| 2. Electrical terminal (17). | Remove terminal protector (14), boot (13), nut (15) and wire (12). |  |

**NOTE**

For the M916 thru M920 only, disconnect tube (23) from top of air dryer assembly (1).

- |                                               |                                                                                                                                   |  |
|-----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------|--|
| 3. Mounting brackets (21).                    | Remove four hexagon nuts (8), four lock washers (9), four flat washers (10) and (19), four capscrews (20) and dryer assembly (1). |  |
| 4. Frame bracket (7).                         | Remove four screws (6), four nuts (4), four washers (5) and two air dryer mounting brackets (21).                                 |  |
| 5. Purge tank reservoir (25).                 | Unscrew and remove tubing (23).                                                                                                   |  |
| 6. Four nuts (26) and four lock washers (27). | Unscrew and remove U-bolts (24) and purge tank reservoir (25).                                                                    |  |

**B. CLEANING AND INSPECTION.**

- |    |                              |  |
|----|------------------------------|--|
| 7. | Clean and inspect all parts. |  |
|----|------------------------------|--|

**C. INSTALLATION.**

- |                                                |                                                                  |  |
|------------------------------------------------|------------------------------------------------------------------|--|
| 8. Air dryer brackets (21), frame bracket (7). | Secure with four screws (6), four washers (5) and four nuts (4). |  |
|------------------------------------------------|------------------------------------------------------------------|--|

**NOTE**

There should be 1/2 inch minimum clearance between fuel tank and mounting brackets (21), This may require moving the fuel tank rearward.

LOCATION/ITEM

ACTION

REMARKS

## NOTE

For location refer to locator illustration  
(para 9-5 e. thru 9-5 j.).

## A. REMOVAL.

## WARNING

Do not remove safety release valve until  
reservoir pressure is fully exhausted.

1. Safety release valve (2).

Unscrew and remove from reservoir (1).

## B. TESTING.

2. Check safety release valve (2),

a. Connect to adjustable  
pressure supply with  
pressure gage between  
valve and supply.

## COMPRESSED AIR SYSTEM.

## 9-16. RESERVOIRS AND AIR LINES MAINTENANCE (Continued).

LOCATION/ITEM

ACTION

REMARKS

## NOTE

For locations of reservoirs see para 9-5 e. thru 9-5 j. of this manual.

## WARNING

Do not remove any reservoir or air line until pressure is fully exhausted from all supply and service reservoirs.

## NOTE

The illustrations below show a typical air reservoir and associated air lines and fittings of the M915 thru M920 truck tractors and chassis. No special instructions or tools are needed if you follow standard shop practice techniques.

ACTION

REMARKS

## NOTE

For location, refer to locator illustration  
(para 9-5 e thru 9-5 j).

## WARNING

Do not remove quick-release valve until  
pressure is fully exhausted from all  
reservoirs.

| <p>Do not remove double-check valve until pressure is fully exhausted from all reservoirs.</p> <p><b>NOTE</b></p> <p>For location, refer to locator illustration (para 9-5 e. thru 9-5 j.). Double-check valves are attached to the rear of the secondary air reservoir and to the engine side of the brake pedal valve on all models. There is a double-check valve on the driver's side of the brake pedal valve on all models except the M918 and M919. All models use a double check valve with stoplamp switch attached to the engine side of the firewall near the brake pedal valve. The procedure below is general and may be used to service any of these double-check valves.</p> |        |         |

## BRAKE SYSTEM,

## 9-28. DOUBLE-CHECK AND STOPLAMP VALVE MAINTENANCE (M918 AND M919) (Continued).

| LOCATION/ITEM            | ACTION                            | REMARKS                       |
|--------------------------|-----------------------------------|-------------------------------|
| <b>A. REMOVAL.</b>       |                                   |                               |
| 1. Fittings (1) and (8). | Unscrew and remove two air lines. | Mark location for reassembly. |
| 2. Tee (2).              | Unscrew and remove.               |                               |

The diagram illustrates the removal of the double check and stoplamp valve assembly. It shows the valve (6) mounted on a bulkhead fitting (5) which is secured to a firewall. Various air lines and fittings (1, 8), tees (2), wires (3), terminals (4), and an elbow (7) are connected to the valve. The firewall is labeled 'FIREWALL ENGINE COMPARTMENT SIDE'.

| LOCATION/ITEM                                                                                                                           | ACTION                                                                   | REMARKS                                                                                                                                                                    |
|-----------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>A. REMOVAL.</b>                                                                                                                      |                                                                          |                                                                                                                                                                            |
| 1. Two brake springs (2).                                                                                                               | Remove with brake spring pliers.                                         | Place notched tip of pliers against hood on spring, un-notched tip against inner ridge of brake shoe (1), squeezing pliers to stretch spring and remove it from the notch. |
| 2. Two brake shoes (1).                                                                                                                 | Remove from clip (18) and lift off shoes.                                |                                                                                                                                                                            |
| 3. Two clips (18), two nuts (19), two lockwashers (20), and two capscrews (21).                                                         | Loosen nut (19) and remove capscrew (21), lockwasher (20) and clip (18). | Remove only if damaged or broken.                                                                                                                                          |
| 4. Two anchor guides (6) and two lockwashers (7).                                                                                       | Remove.                                                                  | Remove only if service on actuator is needed.                                                                                                                              |
| 5. Capscrew (12), lockwasher (11), spring (10), and pawl (9).                                                                           | Remove.                                                                  | Remove only if service on actuator is needed.                                                                                                                              |
| 6. Two seal assemblies (4), plunger (5), two plungers (13), two actuators (14), two seal assemblies (15), and two adjusting bolts (16). | Remove.                                                                  | Clean, inspect, and replace as necessary.                                                                                                                                  |
| 7. Two wedges (8).                                                                                                                      | Remove and clean.                                                        | Replace if damaged.                                                                                                                                                        |
| 8. Dust shield (22), four capscrews (23), and four washers (24).                                                                        | Unscrew capscrews (23).                                                  | Remove only if replacement is needed,                                                                                                                                      |
| <b>B. INSPECTION.</b>                                                                                                                   |                                                                          |                                                                                                                                                                            |
| 9. Two brake springs (2), brake shoes (1), seal assemblies (4) and (15) and all hardware.                                               | Inspect for:<br>a. Dirt.<br>b. Wear.<br>c. Damage.                       | Clean and replace as necessary.                                                                                                                                            |

|---------------|--------|---------|

**C. INSTALLATION.****CAUTION**

If you replace any brake shoe, replace all the shoes on that axle. A combination of new and old shoes on the same axle will cause uneven braking. Make sure that the brake shoes are clean before you install them. Be careful not to get grease or oil on the linings as you assemble them.

- |                                                                                                                                                                                |                                                                                                   |  |

|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. RH and LH camshafts (28) and (29).                                     | Back off on slack adjuster until camshafts (28) and (29) are in fully released position.     |                                                                                                                                                                   |
| 2. Two shoe assemblies (20) and two rollers (26).                         | With a pry bar, pry upon shoe assemblies (20) and pull out rollers (26).                     |                                                                                                                                                                   |
| 3. Spring (30) and two pins (25).                                         | Remove,                                                                                      |                                                                                                                                                                   |
| 4. Two springs (14).                                                      | Tilt shoe assemblies (20) out 180 degrees to release springs (14) and remove.                |                                                                                                                                                                   |
| 5. Two lock screws (15) and two anchor pins (13).                         | Cut lock wire and loosen lock screw (15) to remove anchor pin (13) and shoe assemblies (20). |                                                                                                                                                                   |
| <b>B. INSPECTION.</b>                                                     |                                                                                              |                                                                                                                                                                   |
| 6. Camshafts (28) and (29), bearings (17) and (8), and two bushings (18). | Inspect for excessive wear and looseness in bearings (17), bushing (18), and bearing (8).    |                                                                                                                                                                   |
| 7. Two shoe assemblies (20).                                              | Inspect for wear or damage and replace as necessary.                                         | If linings (22) and (23) are to be serviced separately, refer to Direct Support Maintenance as rivets (24) will have to be drilled out of linings and shoes (21). |
| <b>NOTE</b>                                                               |                                                                                              |                                                                                                                                                                   |
| Perform steps 8 thru 14 only if excessive wear has been found.            |                                                                                              |                                                                                                                                                                   |
| 8. Retaining ring (12) and washer (11).                                   | Remove,                                                                                      |                                                                                                                                                                   |
| 9. Slack adjuster.                                                        | Remove (refer to para 9-39A and B).                                                          |                                                                                                                                                                   |

## BRAKE SYSTEM.

## 9-33. REAR BRAKE SHOES MAINTENANCE (M915) (Continued).

| LOCATION/ITEM                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | ACTION                | REMARKS          |           |                    |            |                   |                    |           |                 |                |             |                     |                   |                |                     |          |            |            |             |                  |            |                 |                  |            |            |            |         |                       |                  |                |              |                 |            |            |  |

| LOCATION/ITEM                                                                                                                                                                                                                                                                                                                                      | ACTION                                                                                                                         | REMARKS                             |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------|
| <div>C. INSTALLATION.</div> <div>CAUTION</div> <p>If you replace any brake shoe, replace all the shoes on that axle. A combination of new and old shoes on the same axle will cause uneven braking. Make sure that the brake shoes are clean before you install them. Be careful not to get grease or oil on the linings as you assemble them.</p> |                                                                                                                                |                                     |
| 10. O-ring (13), seal (8), washer (7), and camshaft (14).                                                                                                                                                                                                                                                                                          | Install bushings (10) and (11), O-ring (13), seal (8), washer (7), and then install camshaft (14) thru bushings (10) and (11). |                                     |
| 11. O-ring (9), seal (8), washer (7), snap ring (6), and grease fitting (12).                                                                                                                                                                                                                                                                      | Install.                                                                                                                       |                                     |
| 12. Two bushings (3) and grease fitting (4).                                                                                                                                                                                                                                                                                                       | Install into spider.                                                                                                           |                                     |
| 13. Two brake shoe assemblies (27).                                                                                                                                                                                                                                                                                                                | Place on spider.                                                                                                               |                                     |
| 14. Two pins (5), two washers (2) and two snap rings (1).                                                                                                                                                                                                                                                                                          | Install snap ring (1) on pin (5) with washer (2) and push through brake shoe assembly (27) and bushing (3).                    |                                     |
| 15. Two washers (2) and two snap rings (1).                                                                                                                                                                                                                                                                                                        | Install washer (2) on back side of pin (5) and install snap ring (1).                                                          |                                     |
| 16. Spring (26) and two pins (23).                                                                                                                                                                                                                                                                                                                 | Install pins (23) and hook up spring (26).                                                                                     |                                     |
| 17. Two rollers (25) and two retainers (24).                                                                                                                                                                                                                                                                                                       | With long handle screwdriver raise brake shoe to allow room to install roller (25) and retainer (24).                          | Repeat operation for opposite shoe. |

## LOCATION/ITEM

## ACTION

## REMARKS

**WARNING**

Do not remove brake chamber until pressure is fully exhausted from all reservoirs.

**NOTE**

The M915 has two front brake air chambers per wheel, while the M916 thru M920 have one.

## BRAKE SYSTEM.

### 9-32. REAR BRAKE AIR CHAMBER MAINTENANCE.

**THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- a. Caging Power Spring. (5)
- b. Removal. (20)
- c. Installation (25)
- d. Uncaging Power Spring. (10)
- e. Operational check. (2)

62 Minutes Total.

## INITIAL SETUP

## APPLICABLE CONFIGURATIONS

All.

## EQUIPMENT CONDITION

## PARAGRAPH

None.

### CONDITION DESCRIPTION

None.

## TEST EQUIPMENT

None.

## SPECIAL TOOLS

None.

### MATERIALS/PARTS (P/N)

Liquid Teflon (Refer to Appendix C).  
Soap and Water Solution.

**PERSONNEL REQUIRED**

Two ( MOS-63B20) .

## SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Parked on Level Ground.

## REFERENCES (TM)

TM 9-2320-273-10.  
TM 9-2320-273-20P.

## GENERAL SAFETY INSTRUCTIONS

Engine OFF.  
Wheels Blocked.  
Transmission in Neutral.

## TROUBLESHOOTING REFERENCES

Table 9-1.

**BRAKE SYSTEM.**

**9-37. REAR BRAKE AIR CHAMBER MAINTENANCE (Continued).**

**LOCATION/ITEM**

**ACTION**

**REMARKS**

**WARNING**

Block the truck wheels before you cage the power spring, since caging the spring releases the parking brakes.

**WARNING**

The spring brake chamber contains a powerful spring. Do not remove the clamp rings or disassemble the chambers even with the compression spring caged. Refer to DS/GS Maintenance if internal service is required.

**LEGEND:**

1. PARK BRAKE CONTROL
2. MANUAL DRAIN VALVE

## AUXILIARY AIR-POWERED COMPONENT SYSTEM.

### 9-41. WINDSHIELD WASHER CONTROL MAINTENANCE.

**THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- a. Removal. (7)
- b. Inspection of Air Lines. (7)
- c. Installation. (1)
- d. Operational Check. (5)

20 Minutes Total.

## INITIAL SETUP

## APPLICABLE CONFIGURATIONS

All.

## EQUIPMENT CONDITION

**PARAGRAPH**

5-37A.

### CONDITION DESCRIPTION

Batteries Disconnected.

## TEST EQUIPMENT

None.

## SPECIAL TOOLS

None.

### MATERIALS/PARTS (P/N)

Liquid Teflon (refer to appendix C).

## PERSONNEL REQUIRED

One (MOS-63B20).

## SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Parked on Level Ground.

## REFERENCES (TM)

TM 9-2320-273-10.

## GENERAL SAFETY INSTRUCTIONS

Engine OFF.  
Transmission in Neutral.  
Park Brake Set.

## TROUBLESHOOTING REFERENCES

Table 9-1.

## AUXILIARY AIR-POWERED COMPONENT SYSTEM.

## 9-41. WINDSHIELD WASHER CONTROL MAINTENANCE (Continued).

| LOCATION/ITEM                   | ACTION                                          | REMARKS |
|---------------------------------|-------------------------------------------------|---------|
| <b>A. REMOVAL.</b>              |                                                 |         |
| 1. Two quarter-turn screws (1). | Loosen so that instrument panel can be lowered. |         |
| 2. Supply line fitting (6).     | Unscrew from valve body (7).                    |         |
| 3. Allen screw (2).             | Remove.                                         |         |
| 4. Control knob (3).            | Remove.                                         |         |
| 5. Nut (4).                     | Loosen and remove.                              |         |
| 6. Valve body (7).              | Remove from back side of panel.                 |         |
| 7. Outlet hose (5).             | Pull off of valve body (7).                     |         |

## AUXILIARY AIR-POWERED COMPONENT SYSTEMS.

## 9-44. DIFFERENTIAL LOCKUP CONTROL VALVE MAINTENANCE.

**THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- Removal. (5)
- Installation. (6)
- Checking for Leaks. (2)

13 Minutes Total.

## INITIAL SETUP

## APPLICABLE CONFIGURATIONS

All.

## TEST EQUIPMENT

None.

## SPECIAL TOOLS

None.

### MATERIALS/PARTS (P/N)

Liquid Teflon (refer to appendix C).  
Soap and Water Solution.

### EQUIPMENT CONDITION

**PARAGRAPH**

9-13A.  
5-83A.

### CONDITION DESCRIPTION

Air Reservoirs Drained.  
Differential Lockup  
Switch Removed.

## PERSONNEL REQUIRED

One (MOS-63B20).

## **SPECIAL ENVIRONMENTAL CONDITIONS**

---

Vehicle Parked on Level Ground.

## REFERENCES (TM)

TM 9-2320-273-10.  
TM 9-2320-273-20P.

## GENERAL SAFETY INSTRUCTIONS

Differential Lockup Engaged.  
Engine OFF.  
Transmission in Neutral.  
Park Brake Set.

## TROUBLESHOOTING REFERENCES

Table 9-1.

AUXILIARY AIR-POWERED COMPONENT SYSTEMS.

9-44. DIFFERENTIAL LOCKUP CONTROL VALVE MAINTENANCE (Continued).

LOCATION/ITEM

ACTION

REMARKS

**WARNING**

Do not remove differential lockup control valve until pressure is completely exhausted from all reservoirs.

**A. REMOVAL.**

1. Two screws ( 1).

Loosen and remove valve (2).

**NOTE**

The figure below shows M915 valve. M916 through M920 valves have three air line connections.

**LEGEND:**

- 1. SCREW (2)
- 2. VALVE
- 3. AIR LINE

TA 074969

## CHAPTER 10

### WHEELS, STEERING, AND SUSPENSION SYSTEMS MAINTENANCE

---

This chapter provides you with the following information related to wheels, steering, and suspension systems maintenance.

- a. All required special tools and equipment.
- b. Other technical manuals.
- c. Troubleshooting procedures.
- d. Maintenance procedures.

---

#### Section I REPAIR PARTS, SPECIAL TOOLS, TMDE AND SUPPORT EQUIPMENT

---

##### **10-2. COMMON TOOLS AND EQUIPMENT.**

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

##### **10-3. SPECIAL TOOLS, TMDE, SUPPORT EQUIPMENT.**

The special tools, TMDE and support equipment required for the wheels, steering, and suspension systems maintenance procedures described in this chapter are limited to the following items: (Refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustration.)

- a. Toe-in gage.
- b. Valve core removing tool.
- c. Gooseneck tool.
- d. Rim tool.
- e. Safety cage.
- f. 4-inch, 6-point wheel bearing nut wrench.
- g. Wheel bearing packing tool.
- h. Wheel dolly.
- i. Tie rod end puller.
- j. Pitman arm removing tool.
- k. Pitman arm spacer.
- l. Spacer removing tool.
- m. Ball joint puller.

#### **10-4. SPARES AND REPAIR PARTS.**

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools List covering organizational maintenance for this equipment (TM 9-2320-273-20P).

---

## **Section II TROUBLESHOOTING**

---

#### **10-5. INTRODUCTION.**

Tables 10-1 thru 10-3 contain instructions for troubleshooting the wheels, steering, and vehicle suspension. The correction actions describe how to fix the problem or refer to a procedure for fixing the problem. The troubleshooting tables are arranged by malfunctions in the following order.

WHEELS AND TIRES (table 10-1):

- a. Tires wearing unevenly,
- b. Noisy or bumpy sound while traveling down the road.

STEERING (table 10-2):

- a. Front tires wearing unevenly.
- b. Hard steering.
- c. Vehicle wanders or pulls to one side.
- d. Lost motion or excessive play in steering wheel.
- e. Temporary increase in effort when turning steering wheel.
- f. Vehicle does not fully steer from stop to stop.

SUSPENSION (table 10-3):

- a. Vehicle wanders or shimmies.
- b. Pusher axle will not raise or lower.
- c. Rear axle assembly not tracking properly.

**Table 10-1. Wheel and Tire Troubleshooting Procedures.**

| MALFUNCTION.                                           |                                                                                                                                                                                                                                                    |
|--------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                    |                                                                                                                                                                                                                                                    |
| CORRECTIVE ACTION.                                     |                                                                                                                                                                                                                                                    |
| <hr/>                                                  |                                                                                                                                                                                                                                                    |
| 1. TIRES WEARING UNEVENLY:                             |                                                                                                                                                                                                                                                    |
| Step 1.                                                | Check wheel alinement if problem is on front wheels.<br>Aline front wheels (para 10-10).                                                                                                                                                           |
| Step 2.                                                | Check rear brakes for proper adjustment. (Front brakes are self -adjusting.)<br>Adjust brakes ( para 9-33, 9-34, 939).                                                                                                                             |
| Step 3.                                                | Check wheel bearing for adjustment, lubrication, and damage.<br>Adjust, lubricate, or replace (para 10-13, 10-14, 10-15 or 10-16, as applicable).                                                                                                  |
| 2. NOISY OR BUMPING SOUND WHILE TRAVELING ON THE ROAD: |                                                                                                                                                                                                                                                    |
| Step 1.                                                | Check lug wheel stud cap nuts for proper torque.<br>Tighten lug nuts to 450 lb-ft (610 N.m).                                                                                                                                                       |
| Step 2.                                                | Inspect U-bolts for tightness.<br>Tighten U-bolts (125-165 lb-ft (170-224 N.m) for M915, 200-270 lb-ft (271-366 N.m) for M916 thru M920).                                                                                                          |
| Step 3.                                                | Inspect spring shackle pins for looseness using a pry bar. No noticeable movement is allowable.<br>Refer to Direct Support Maintenance.                                                                                                            |
| Step 4.                                                | Check wheel bearings for vertical looseness using a prying bar beneath the tire. Check for proper lubrication and damage.<br>Adjust, lubricate, or replace bearing (para 10-13, 10-14, 10-15 or 10-16, as applicable).                             |
| Step 5.                                                | Inspect rear axle shaft for damage by jacking up both wheels. Turn wheels to one extreme and rotate one wheel by hand while listening for a rumbling or grinding sound within the axle. Repeat on other wheel.<br>Replace axle shaft (para 10-15), |
| Step 6.                                                | Check pusher axle for damaged components or leaking air lines.<br>Replace components as necessary (para 9-38, 10 16) or contact Direct Support Maintenance.                                                                                        |

Table 10-1. Wheel and Tire Troubleshooting Procedures (Continued).

|                                                                                                                                                                                                    |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| MALFUNCTION.                                                                                                                                                                                       |
| TEST OR INSPECTION.                                                                                                                                                                                |
| CORRECTIVE ACTION.                                                                                                                                                                                 |
| 2. NOISY OR BUMPING SOUND WHILE TRAVELING ON THE ROAD (Continued):<br>Step 7. Inspect front driving axle (M916 thru M920) as in Step 5.<br>Refer to paragraph 10-14 or Direct Support Maintenance. |

**Table 10-2. Steering Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | TEST OR INSPECTION. | CORRECTIVE ACTION. |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------|--------------------|
| <p>1. FRONT TIRES WEARING UNEVENLY:</p> <p>Step 1. Inspect U-bolts for tightness.<br/>Tighten U-bolts (125-165 lb-ft (170-224 N-m) for M915;<br/>200-270 lb-ft (271-366 N-m for M916 thru M920).</p> <p>Step 2. Inspect spring shackle pins for looseness using a pry bar. No noticeable movement is allowable.<br/><br/>Refer to Direct Support Maintenance.</p> <p>Step 3. Check wheel bearings for vertical looseness using a pry bar beneath the tire. Check for proper lubrication and damage,<br/><br/>Adjust, lubricate, or replace bearing (para 10-13 or 10-14, as applicable).</p> <p>Step 4. Check for proper toe-in (0 to 1/8-inch).<br/><br/>Adjust toe-in (para 10-10).</p> <p>Step 5. Check brakes for proper adjustment.<br/><br/>Adjust brakes (para 9-31 and 9-32).</p> <p>2. HARD STEERING:</p> <p>Step 1. Check oil level in power steering pump.<br/><br/>Fill to proper level (LO 9-2320-273-12).</p> <p>Step 2. Check all steering linkage for proper lubrication.<br/><br/>Lubricate (LO 9-2320-273-12).</p> <p>Step 3. Check U-bolts for tightness.<br/><br/>Tighten U-bolts (125-165 lb-ft (170-224 N-m) for M915;<br/>200-270 lb-ft (271-366 N-m) for M916 thru M920).</p> <p>Step 4. Inspect all hydraulic lines and fittings for leakage or damage.<br/><br/>Tighten or replace lines or fittings (para 10-22 and 10-23).</p> <p>Step 5. Check tie rod for damage or loose ends. No play is allowable.<br/><br/>Tighten or replace (para 10-20).</p> |                     |                    |

*Table 10-2. Steering Troubleshooting Procedures (Continued).*

| MALFUNCTION.                                                                                 |                                                                                                         |
|----------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                                                          |                                                                                                         |
| CORRECTIVE ACTION.                                                                           |                                                                                                         |
| 2. HARD STEERING (Continued):                                                                |                                                                                                         |
| Step 6. Inspect drag link for damage.                                                        | Replace drag link (para 10-19).                                                                         |
| Step 7. Check steering gear for proper adjustment.                                           | Refer to Direct Support Maintenance.                                                                    |
| Step 8. Inspect axle shaft for damage (M916 thru M920).                                      | Refer problem to Direct Support Maintenance.                                                            |
| 3. VEHICLE WANDERS OR PULLS TO ONE SIDE:                                                     |                                                                                                         |
| Step 1. Check U-bolts for tightness.                                                         | Tighten U-bolts (125-165 lb-ft (170-224 N.m) for M915, 200-270 lb-ft (271-336 N-m) for M916 thru M920). |
| Step 2. Check front spring pin for damage by using a pry bar. No noticeable play is allowed. | Refer to Direct Support Maintenance.                                                                    |
| Step 3. Check auxiliary cylinder for damage (M916 thru M920).                                | Replace cylinder (para 10-23).                                                                          |
| Step 4. Check drag link for damage.                                                          | Replace drag link (para 10-19).                                                                         |
| Step 5. Check tie rod for looseness or damage.                                               | Adjust or replace tie rod assembly (para 10-20).                                                        |
| Step 6. Check for dragging brake by jacking vehicle and spinning wheel by hand.              | Adjust brake (para 9-31 and 9-32).                                                                      |
| Step 7. Check hub and drum for damage.                                                       | Replace (para 10-13 or 10-14, as applicable).                                                           |

Table 10-2. Steering Troubleshooting Procedures (Continued).

| MALFUNCTION.                                                 | TEST OR INSPECTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | CORRECTIVE ACTION. |
|--------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------|
| 3. VEHICLE WANDERS OR PULLS TO ONE SIDE (Continued):         | <p>Step 8. Check wheel bearing adjustment by using a pry bar. No noticeable play is allowable. Check for proper lubrication or damage.</p> <p>Adjust, lubricate, or replace bearing (para 10-13 or 10-14, as applicable).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |                    |
| 4. LOST MOTION OR EXCESSIVE PLAY IN STEERING WHEEL:          | <p>Step 1. Check free play. Tape a piece of stiff wire or weld rod to the instrument panel so that one end is near the rim of the steering wheel. Turn the wheel to one extreme of free travel (wheels do not move) and mark the wheel at the wire. Turn the wheel the other way to the end of the free play and mark the wire position on the wheel. Measure the free play around the circumference of the steering wheel. Maximum free play with engine running is 2-1/2 inches.</p> <p>Refer to Direct Support Maintenance.</p> <p>Step 2. Check drag link for looseness or damage.</p> <p>Replace drag link (para 10-19).</p> <p>Step 3. Check tie rod for damage or loose end. No free play is allowable in tie rod end.</p> <p>Adjust or replace tie rod (para 10-20).</p> <p>Step 4. Check pitman arm for damage.</p> <p>Replace pitman arm (para 10-21).</p> <p>Step 5. Check pump reservoir for damage.</p> <p>Replace reservoir (para 10-22).</p> <p>Step 6. Check auxiliary cylinder for damage. (M916 thru M920).</p> <p>Replace cylinder (para 10-23).</p> |                    |
| 5. TEMPORARY INCREASE IN EFFORT WHEN TURNING STEERING WHEEL. | <p>Step 1. Check all steering linkage for proper lubrication.</p> <p>Lubricate (LO 9-2320-273-12).</p> <p>Step 2. Check hydraulic reservoir for damage and leakage.</p> <p>Replace reservoir (para 10-22).</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |                    |

**Table 10-2. Steering Troubleshooting Procedures (Continued).**

| MALFUNCTION.                                                             | TEST OR INSPECTION.                                                                                                                                                                                                                     | CORRECTIVE ACTION.                         |
|--------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|
| 5. TEMPORARY INCREASE IN EFFORT WHEN TURNING STEERING WHEEL (Continued): |                                                                                                                                                                                                                                         |                                            |
|                                                                          | Step 3. Check steering gear mounting bolts for tightness.                                                                                                                                                                               | Tighten to 180 lb-ft (244 N-m).            |
|                                                                          | Step 4. Check steering gear adjustment.                                                                                                                                                                                                 | Refer to Direct Support Maintenance.       |
|                                                                          | Step 5. Check auxiliary cylinder for damage or leakage (M916 thru M920).                                                                                                                                                                | Replace cylinder (para 10-23).             |
|                                                                          | Step 6. Inspect drag link for damage.                                                                                                                                                                                                   | Replace drag link (para 10-19).            |
|                                                                          | Step 7. Inspect tie rod for damage or loose end. No play is allowable.                                                                                                                                                                  | Replace tie rod end (para 10-20).          |
|                                                                          | Step 8. (All models except M915). Inspect axle shaft for damage by jacking up both wheels, turning wheels to one extreme, and rotating one wheel by hand. Listen for rumbling or grinding sound within the axle. Repeat on other wheel. | Refer to Direct Support Maintenance.       |
| 6. VEHICLE DOES NOT FULLY STEER FROM STOP TO STOP:                       |                                                                                                                                                                                                                                         |                                            |
|                                                                          | Step 1. Check all steering linkage for proper lubrication.                                                                                                                                                                              | Lubricate (LO 9-2320-273-12).              |
|                                                                          | Step 2. Check pitman arm for damage.                                                                                                                                                                                                    | Replace pitman arm (para 10-21).           |
|                                                                          | Step 3. Check drag link for damage or looseness. No play is allowable.                                                                                                                                                                  | Replace drag link (para 10-19).            |
|                                                                          | Step 4. Check the tie rod for damage or loose end. No play is allowable.                                                                                                                                                                | Replace tie rod end if loose (para 10-20). |
|                                                                          | Step 5. Check steering gear mounting bolts for tightness,                                                                                                                                                                               |                                            |
|                                                                          | a. Tighten bolts to 180 lb-ft (244 N.m).                                                                                                                                                                                                |                                            |
|                                                                          | b. Refer to Direct Support Maintenance.                                                                                                                                                                                                 |                                            |

**Table 10-3. Suspension Troubleshooting Procedures**

| MALFUNCTION.                                                                                                                                                                                                                   |                                                                                                                 |
|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                                                                                                                                                                                            |                                                                                                                 |
| CORRECTIVE ACTION.                                                                                                                                                                                                             |                                                                                                                 |
| <hr/>                                                                                                                                                                                                                          |                                                                                                                 |
| 1. VEHICLE WANDERS OR SHIMMIES:                                                                                                                                                                                                |                                                                                                                 |
| Step 1. Check for insufficient lubrication.                                                                                                                                                                                    | Lubricate (LO 9-2320-273-12).                                                                                   |
| Step 2. Check for loose wheel stud cap nuts.                                                                                                                                                                                   | Tighten nuts to 450 lb-ft (610 N-m).                                                                            |
| Step 3. Check for loose spring U-bolts.                                                                                                                                                                                        | Tighten nuts on U-bolts (125-165 lb-ft (170-224 N-m) for M915, 200-270 lb-ft (271-366 N-m) for M916 thru M920). |
| Step 4. Check wheel bearings for play using a pry bar.                                                                                                                                                                         | Adjust or replace bearing (para 10-13 or 10-14, as applicable).                                                 |
| Step 5. Inspect tie rod for damage and ends for looseness. No play is allowable.                                                                                                                                               | Replace tie rod end if loose (para 10-20).                                                                      |
| Step 6. Inspect drag link for damage.                                                                                                                                                                                          | Replace drag link (para 10-19).                                                                                 |
| Step 7. Check propeller shafts and universal joints for wear and damage. Wear is indicated by any movement between the shaft and the joint in any direction.                                                                   | Replace (para 8-11).                                                                                            |
| Step 8. Check spring pins for wear using a pry bar, No noticeable movement is allowed.                                                                                                                                         | Refer to Direct Support Maintenance.                                                                            |
| Step 9. (N/A M915). Check front axle shaft for damage by jacking up both wheels, turning wheels to one extreme and rotating one wheel by hand. Listen for a rumbling or grinding sound within the axle. Repeat on other wheel. | Refer to Direct Support Maintenance.                                                                            |

*Table 10-3. Suspension Troubleshooting Procedures (Continued)*

| MALFUNCTION.                                 |                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                          |                                                                                                                                                                                                                                                                                                       |
| CORRECTIVE ACTION.                           |                                                                                                                                                                                                                                                                                                       |
| 2. PUSHER AXLE WILL NOT RAISE OR LOWER:      |                                                                                                                                                                                                                                                                                                       |
| Step 1.                                      | Check air bags for damage and leakage by listening for a hissing sound or using a soap solution and watching for bubbles.<br>Replace air bags (para 8-14).                                                                                                                                            |
| Step 2.                                      | Check air lines for leakage using a soap solution.<br>Replace lines (para 8-14 and 8-15).                                                                                                                                                                                                             |
| Step 3.                                      | Check lifting bags for damage.<br>Replace defective bags (para 8-15).                                                                                                                                                                                                                                 |
| Step 4.                                      | Inspect all brackets and connecting arms for bends or other damage.<br>Refer to Direct Support Maintenance.                                                                                                                                                                                           |
| Step 5.                                      | Check control valves for damage and leakage using a soap solution with valve under pressure. A 1-inch bubble in 5 seconds is permissible.<br>Tighten connections and/or replace the control valves (para 8-17 pusher axle pressure regulator valve, or para 8-18 pusher axle up-down selector valve). |
| Step 6.                                      | Check shock absorbers for damage and tight mounting.<br>Tighten or replace (para 10-25).                                                                                                                                                                                                              |
| 3. REAR AXLE ASSEMBLY NOT TRACKING PROPERLY: |                                                                                                                                                                                                                                                                                                       |
| Step 1.                                      | (M915, M916, M920). Check fifth wheel for secure mounting. This step applies only if a trailer is attached.<br>Tighten, refer to torque table, para 3-9.                                                                                                                                              |
| Step 2.                                      | Check torque rod for security and damage.<br>Tighten (105 lb-ft (142 N-m) for the M915, 180 lb-ft (244 N-m) for the M916 thru M920), or replace (para 10-26).                                                                                                                                         |
| Step 3.                                      | Check for dragging brake by jacking vehicle and rotating wheels by hand.<br>Adjust or replace (para 9-33, 9-34). Refer to Direct Support Maintenance.                                                                                                                                                 |

**Table 10-3. Suspension Troubleshooting Procedures (Continued).**

| <p>MALFUNCTION.</p> <p>TEST OR INSPECTION.</p> <p>CORRECTIVE ACTION.</p>                                                                                                                                                                                                                                                                                                                                               |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p>3. REAR AXLE ASSEMBLY NOT TRACKING PROPERLY (Continued):</p> <p>Step 4. Check wheel bearing adjustment using a pry bar. No noticeable movement is allowable. Check for damage and proper lubrication.</p> <p style="padding-left: 40px;">Adjust, lubricate, or replace (para 10-15 or 10-16).</p> <p>Step 5. Check hubs and drums for damage.</p> <p style="padding-left: 40px;">Replace (para 10-15 or 10-16).</p> |

## Section III MAINTENANCE PROCEDURES

---

### **10-6. INTRODUCTION.**

This section provides you with Organizational Level maintenance procedures for the wheels, steering, and suspension systems. To find a specific maintenance procedure, see one of the following task summaries:

- a. Wheels and Tires (para 10-7).
- b. Steering Mechanism (para 10-8).
- c. Suspension System (para 10-9).

This page intentionally left blank.

| 10-7. WHEEL AND TIRE MAINTENANCE TASK SUMMARY.                                                                                                                                                                                                                                                                                                                                                                                                                |                                              |                                                                                                                                                                                                                                                                                                                                                                                           |                                                     |

## 10-11. TIRE AND TUBE MAINTENANCE (M915) (Continued).

LOCATION/ITEM

ACTION

REMARKS

### WARNING

Always remove the valve core and exhaust all air from a single tire and from both tires of a dual assembly prior to removing any rim components, or any wheel components, such as nuts and rim clamps.

Check the valve stem by running a piece of wire through the stem to make sure it is not plugged.

| LOCATION/ITEM                              | ACTION                                                                                                                             | REMARKS                                                                                                     |
|--------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|
| <b>A. REMOVAL.</b>                         |                                                                                                                                    |                                                                                                             |
| 1. Valve cap (7).                          | Remove.                                                                                                                            | Cap can also be used to remove core.                                                                        |
| 2. Valve stem (6).                         | Remove core with valve core removing tool or valve cap.                                                                            |                                                                                                             |
| 3. Tire (1).                               | Use gooseneck tool to free tire bead from lockring (3) all around tire.                                                            | A heavy soft headed mallet may be helpful in breaking tire loose from lockring.                             |
| 4. Lockring (3).                           | Use rim tool to pry lockring (3) free from rim (2).                                                                                |                                                                                                             |
| 5. Tire (1) and rim (2) assembly.          | a. Turn over.<br>b. Use gooseneck tool to separate second tire bead from rim.<br>c. Remove tire (1), inner liner (4) and tube (5). |                                                                                                             |
| 6. Tube (5) and inner liner (4).           | Remove from tire (1).                                                                                                              |                                                                                                             |
| 7. Tire (1), tube (5) and inner liner (4). | Inspect for:<br>a. Excessive wear.<br>b. Uneven wear.<br>c. Cracks.<br>d. Leaks.                                                   | Replace, if necessary, or repair.<br><br>See TM 9-2610-200-20 for information on pneumatic tires and tubes. |
| 8. Rim (2).                                | Inspect for:<br>a. Rust streaks.<br>b. Corrosion.<br>c. Cracked rims.<br>d. Damaged threads on studs.<br>e. Wheel cracks.          | Replace, if necessary.<br><br>For rust streaks or corrosion, wire brush and repaint.                        |

# WHEELS AND TIRES.

## 10-11. TIRE AND TUBE MAINTENANCE (M915) (Continued).

LOCATION/ITEM

ACTION

REMARKS

### C. INSTALLATION.

#### WARNING

Mismatched tires will make truck handle poorly and may cause accidents. All tires on an axle should have the same diameter,  $\pm 1/8$  inch (3.2 mm). When replacing a tire, measure it and the other tires on the axle to be sure that the distances from top to bottom do not vary by more than  $1/4$  inch (6.4 mm). Use a depth gage to measure tires.

## WHEELS AND TIRES.

## 10-12. TIRE AND TUBE MAINTENANCE (M916 THRU M920) (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

**WARNING**

Always remove the valve core and exhaust all air from a single tire and from both tires of a dual assembly prior to removing any rim components, or any wheel components, such as nuts and rim clamps.

Check the valve stem by running a piece of wire through the stem to make sure it is not plugged.

**A. REMOVAL.**

1. Valve cap (8).

Remove.

Cap can also be used to remove core.

2. Valve stem (7).

Remove core with valve core removing tool, or valve cap.

INSPECTION.</b>                                         |                                                                                                                                    |                                                                                                             |
| 7. Tire (1) tube (6) and inner liner (5).                     | Inspect for:<br>a. Excessive wear.<br>b. Uneven wear.<br>c. Cracks.<br>d. Leaks.                                                   | Replace, if necessary, or repair.<br><br>See TM 9-2610-200-20 for information on pneumatic tires and tubes. |
| 8. Rim (2).                                                   | Inspect for:<br>a. Rust streaks.<br>b. Corrosion.<br>c. Cracked rims.<br>d. Damaged threads on studs.<br>e. Wheel cracks.          | Replace, if necessary.<br><br>For rust streaks or corrosion, wire brush and repaint.                        |

## WHEELS AND TIRES

## 10-12. TIRE AND TUBE MAINTENANCE (M916 THRU M920) (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## C. INSTALLATION.

## WARNING

Mismatched tires will make truck handle poorly and may cause accidents. All tires on an axle should have the same diameter,  $\pm 1/8$  inch (3.2 mm) when replacing a tire, measure it and the other tires on the axle to be sure that the distances from top to bottom do not vary by more than  $1/4$  inch (6.4 mm). Use a depth gage to measure tires.

9. Tire (1), tube (6), rim (2), and inner liner (5).

- a. Place tube in tire.
- b. Place liner over tube.
- c. Lubricate both beads of tire with soap solution.
- d. Place valve stem (7) through hole in rim.

Rim should be laying with outer side on top.

## ACTION

## REMARKS

## C. PACKING AND INSTALLATION OF BEARINGS (Continued).

## CAUTION

Be careful not to damage oil seal (2) as you install the hub and drum assembly.

10. Hub and drum assembly (5).

- a. Mount assembly on spindle (1).
- b. Press hub until inner bearing cone (3) is seated flush on spindle.

11. Outer bearing cone (7).

- a. Use wheel bearing packing tool to pack with grease, or pack by hand.
- b. Place on spindle (1) against outer bearing cup (6). Small end of bearing should point towards truck.

| 8. (M915 Only) Oil Slinger (14), five washers (15) and capscrews (16).                                                                                                                                                                      | Remove.                                                                           |                                                                                                                                            |
| 9. Inner bearing seal (18), inner wheel bearing (17), and inner oil seal wiper (19).                                                                                                                                                        | a. Remove.<br><br>b. Throw away inner bearing seal (18).                          | a. You should now be reaching into the side of the hub that was facing the truck.<br><br>b. Replace inner oil seal wiper (18), if damaged. |

## WHEELS AND TIRES.

## 10-15. REAR WHEEL BEARINGS, SHAFTS, AND SEALS MAINTENANCE (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

**B. INSPECTION OF BEARINGS.**

10. Outer wheel bearing (12) and inner wheel bearing (17).

Replace, if necessary.

- a. Inspect for:
1. Missing rollers.
  2. Flat, chipped, or pitted surfaces.
  3. Discoloration.
  4. Secure fit.

| 16. Preload nut (11).                           | a. Install preload nut using wheel bearing nut wrench.<br>b. If reusing the same bearings, torque to 50 lb-ft (68 N•m) while rotating wheel in both directions,<br>c. If new bearings have been installed, torque to 100 lb-ft (136 N•m) while rotating wheel in both directions, back off to 0 lb-ft. Torque to 50 lb-ft.<br>d. Back off preload nut no more than 1/4 turn counterclockwise. |         |
| 17. Keyed spacer (10) and locknut (9).          | a. Install with wheel bearing nut wrench.<br>b. Torque locknut (9) to 250-400 lb-ft (340-544 N•m).                                                                                                                                                                                                                                                                                            |         |

## WHEELS AND TIRES.

## 10-15. REAR WHEEL BEARINGS, SHAFTS, AND SEALS MAINTENANCE (Continued).

| LOCATION/ITEM | ACTION | REMARKS |
|---------------|--------|---------|
|---------------|--------|---------|

**C. PACKING AND INSTALLATION OF BEARINGS (Continued)**

- |                                                                                     |                                                                                     |
|-------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|
| 18. New bearing seal (2), two new flange gaskets (1), and outer oil seal wiper (8). | Put in place over studs (13).                                                       |
| 19. Axle shaft (3).                                                                 | Set in place.                                                                       |
| 20. Eight tapered spacers (4), star washers (5), and nuts (6).                      | Screw on. Tighten to 175 lb-ft (237 N•m) with torque wrench. Tighten in this order: |

**NOTE**

Follow-on maintenance action required:  
After road testing vehicle, check for oil leaks.

|  <p>The diagram shows a side view of the steering wheel assembly. A steering wheel is mounted on a vertical shaft. A nut is shown being tightened onto the top of the shaft. The steering wheel has four spokes. To the right of the steering wheel is a control panel with various buttons and switches. A legend box is located to the right of the diagram.</p> |                                                                                                                                                                         |         |

Turn wheel left or right for easy accessibility in performing task.

**A. REMOVAL.**

1. Cotter pins (2) and (5).

Remove with pliers and throw away.

If pins stick, tighten or loosen castle nuts (3) and (6) slightly to align slot.

2. Castle nuts (3) and (6).

a. Back off nuts until they are flush with threaded portion of shaft.

b. Using a sledge hammer hit this area until drag link unseats.

c. Unscrew and remove.

| LOCATION/ITEM                                | ACTION                                                                                                                                                                                                                                                          | REMARKS                                      |
|----------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------|
| <b>A. REMOVAL (Continued).</b>               |                                                                                                                                                                                                                                                                 |                                              |
| 2. Two cotter keys (2) and nuts (1).         | Remove from ball joints (7) on each side.                                                                                                                                                                                                                       |                                              |
| 3. Two ball joints (7).                      | a. Using ball joint puller or tapping with mallet remove from steering arms (8) on each side (M915). Remove from knuckles (10) (M916 thru M920).<br>b. Lower and remove tie rod (4) with ball joints (7) by unfastening and lowering rope sling on either side. |                                              |
| 4. Two bolts (3), washers (5), and nuts (6). | Loosen.                                                                                                                                                                                                                                                         |                                              |
| 5. Two ball joints (7).                      | a. Counting the number of turns, unscrew from tie rod (4).<br>b. Slide off clamp (11) from tie rod (4).                                                                                                                                                         |                                              |
| <b>B. INSPECTION OF END ASSEMBLIES.</b>      |                                                                                                                                                                                                                                                                 |                                              |
| 6. Two ball joints (7).                      | Holding tie rod connection in one hand and steering arm connection in other hand, check for any play or looseness.                                                                                                                                              | If there is any looseness, replace assembly. |
| <b>C. INSTALLATION.</b>                      |                                                                                                                                                                                                                                                                 |                                              |
| 7. Two ball joints (7).                      | a. Slide one clamp (11) onto either end of tie rod (4).<br>b. Screw onto tie rod (4), using same number of turns as you counted in step 5.                                                                                                                      |                                              |
| 8. Two bolts (3), washers (5), and nuts (6). | Install thru two clamps (11) and torque to 40-55 lb-ft (54-74 N•m).                                                                                                                                                                                             |                                              |
| 9. Two ball joints (7).                      | Fasten ropes to tie downs (9) and tie rods (4) and hoist up into steering arms (8) (M915) or knuckles (10) (M916 thru M920). Tie rope sling securely.                                                                                                           |                                              |

## STEERING MECHANISM.

## STEERING MECHANISM.

## 10-21.2. STEERING STOP INSPECTION AND ADJUSTMENT PROCEDURES (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## NOTE

Check that alignment marks on the pitman arm steering gear sector shaft are in alignment before performing the steering stop adjustment procedure.

1. Template (23), steering knuckle housing (16), and three cover bolts (4).

Install.

Put template on top of housing, and partially install bolts to position template.

2. Front brake drums (24).

Center and measure.

Make two measurements, the first at the forward side of the brake drum, measuring the distance "d" from the frame to the back of the brake drum. Then make the same measurement at the rear of the brake drum. Adjust as necessary to make the measurements equal.

3. Template (23).

Mark lines.

Put straight edge on zero degree reference line (25) and mark a line (26) across the king pin. Line (26) should be perpendicular to the line of travel (27).

## NOTE

A 1/8-inch spacer must be used when adjusting the steering stops in order to acquire the correct steer angle.

4. 1/8-inch spacer (28), steering stop bolt (19), steering stop boss (29), brake drum (24), king pin line (26), 32 degree reference line (30), template (23), and jam nut (18).

Position, adjust, and tighten.

Put spacer between steering stop bolt and steering stop boss, turn brake drum full left until king pin line aligns with 32 degree reference line on template. If the 32 degree reference line does not line up with the king pin line, adjust steering stop bolt. Tighten jam nut and remove spacer.

STEERING MECHANISM.

10-21.2. STEERING STOP INSPECTION AND ADJUSTMENT PROCEDURES (Continued).

|                                                                                                                |                                           |                                                                                                                                                                                                                      |

## STEERING MECHANISM.

## 10-21.3. STEERING GEAR POPPET ADJUSTMENT (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## CAUTION

When setting poppets, do not hold steering in full lock position for more than 15 seconds. If full lock position is held for more than 15 seconds, excessive heat will build up in system and extensive damage may occur.

## NOTE

Poppet adjusting screws are adjusted to relieve pressure at 32 degree steering angle. Make sure 1/8-inch (3mm) spacer is between steering knuckle stop screw and axle beam boss when adjusting poppet adjusting screws.

## NOTE

The power steering pump has an internal system relief valve to limit maximum pump pressure to 1850-2050 psi (12756-14135 kPa). Observed operating pressure is variable and dependent on the resistance within the steering system (e.g. tire inflation, floor surface). Typically, system pressure will be approximately 1100-1500 psi (7585-10343 kPa) with properly inflated tires on concrete floor.

4. Rear poppet adjusting screw (35), and locknut (36).

Adjust, lock and tighten.

Note system operating pressure on analyzer as you turn wheel from straight ahead to full left. Pressure should be above 900 psi (6205 kPa) until the steering stop contacts the 1/8-inch spacer and steering stop boss, then drops to 400-900 psi (2758-6205 kPa). If observed operating pressure does not hold until the stop makes contact, back out the left side rear poppet adjusting screw.

Table 10-2.

## STEERING AND ALINEMENT.

## 10-22. HYDRAULIC POWER STEERING PUMP AND OIL COOLER MAINTENANCE (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## CAUTION

Dirt may severely damage the power steering system. Make sure your work area is clean. Cover openings in the pump to keep dust out.

## A. REMOVAL.

1. Two capscrews (6) and washers (5).

Remove.

Push engine retarder switch (4) aside.

## STEERING AND ALINEMENT.

## 10-22. HYDRAULIC POWER STEERING PUMP AND COOLER MAINTENANCE (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## NOTE

Follow-on maintenance required:

Install fender; refer to paragraph 11-14B OR D.

Install grille; refer to paragraph 11-16D.

Install fuel filter and adapter; refer to paragraph 4-18B (M916 thru M920).

## STEERING AND ALINEMENT.

## 10-22. HYDRAULIC POWER STEERING PUMP AND COOLER MAINTENANCE (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

**CAUTION**

At temperatures at or below 0°F, the cooler must be disconnected from the power steering fluid system. Failure to do so may cause the cooler tubing to rupture. The proper procedure is to disconnect one hose (12) which runs from the steering gear to the cooler (20) and reconnect same to the hydraulic pump and reservoir assembly (3). Then, the hose from the cooler to the reservoir should be taken off and reconnected to the cooler input per illustration below.

- a. Removal. (10)  
 b. Cleaning and inspection. (10)  
 c. Installation. (10)  
 30 Minutes Total.

**INITIAL SETUP****APPLICABLE CONFIGURATIONS**

M915.

**EQUIPMENT CONDITION****PARAGRAPH**

None.

**CONDITION DESCRIPTION**

None.

**TEST EQUIPMENT**

None.

**SPECIAL TOOLS**

None.

**MATERIALS/PARTS (P/N)**

GAA (Refer to Appendix C).  
 Shock Absorbers (2) (2540-00-740-961 7).  
 Rubber Bushings (8) (6365-00-740-9618).  
 Nonflammable Cleaning Solvent SD-2 (Refer to Appendix C).

**PERSONNEL REQUIRED**

One (MOS-63B20).

**SPECIAL ENVIRONMENTAL CONDITIONS**

Vehicle Parked on Level Ground.

## SUSPENSION SYSTEM.

## 10-24. FRONT AXLE SHOCK ABSORBERS MAINTENANCE (Continued).

## LOCATION/ITEM

## ACTION

## REMARKS

## NOTE

- a. Shock absorbers should be replaced in pairs. Perform the following procedure twice, once on each side of the truck.
- b. Shock absorbers should be replaced if:
  1. Spring action is not dampened, indicating worn shock absorbers.
  2. Fluid leakage is noted on outer shock absorber surfaces; bottom section.
- c. Procedure is written based upon need for new shock absorbers.

## LOCATION/ITEM

## ACTION

## REMARKS

## NOTE

Shock absorbers should be replaced in pairs. Perform the following procedures twice, once on each side of the truck. Shock absorbers should be replaced if spring action is not dampened or if fluid leakage is noted on outer shock absorber surfaces, bottom section. This procedure is based upon need for new shock absorbers.

**CHAPTER 11****FRAME, BODY AND CAB MAINTENANCE**

---

---

**11-1. OVERVIEW.**

---

This chapter provides you with the following information related to frame, body and cab maintenance:

- a. All required special tools and equipment.
- b. Other technical manuals.
- c. Troubleshooting procedures.
- d. Maintenance procedures.

**CAUTION**

- a. Do not drill holes in frame flanges.
- b. Do not weld frame.

---

**Section I REPAIR PARTS, SPECIAL TOOLS, TMDE AND SUPPORT EQUIPMENT**

---

---

**11-2. COMMON TOOLS AND EQUIPMENT.**

---

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

---

**11-3. SPECIAL TOOLS, TMDE, SUPPORT EQUIPMENT.**

---

The special tools, TMDE and support equipment required for the frame, body and cab maintenance procedures described in this chapter are limited to the 1000-lb hoist and lift hook. (Refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustrations.)

---

**11-4. SPARES AND REPAIR PARTS.**

---

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools List covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

## Section II TROUBLESHOOTING

---

---

### **11-5. INTRODUCTION.**

---

Table 11-1 contains instructions for troubleshooting the frame components. The corrective actions describe how to fix a problem or refer to a procedure for fixing the problem. The Troubleshooting table is arranged by malfunctions in the following order:

FRAME :

- a. Towing pintle does not pivot or latch, or jaw is stuck (Malfunction No. 1).
- b. Excessive jerking of towed trailer (Malfunction No. 2).
- c. Excessive noise or popping sounds from fifth wheel when turning (Malfunction No. 3).

**Table 11-1. Frame Troubleshooting Procedures.**

| MALFUNCTION.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | TEST OR INSPECTION. | CORRECTIVE ACTION. |

## Section III MAINTENANCE PROCEDURES

---

---

### 11-6. INTRODUCTION.

---

This section provides you with Organizational Level Maintenance procedures for the frame, body, and cab. To find a specific maintenance procedure, see one of the following task summaries.

- a.* Frame (para 11-7).
- b.* Body and Cab (para 11-8).

**11-7. FRAME MAINTENANCE TASK SUMMARY.****INITIAL SETUP****APPLICABLE CONFIGURATIONS**

All.

**EQUIPMENT CONDITION****PARAGRAPH**(See TM 9-2320-273-10).  
11-16E.**CONDITION DESCRIPTION**Spare Wheel/Tire Removed.  
Brush Guard Removed (M916  
Thru M920).**TEST EQUIPMENT**

None.

**TOOLS**1,000 lb Hoist.  
Lift Hook.  
M916 and M920 5th Wheel Adjustment Tool (CT447ALX2).**MATERIALS/PARTS (P/N)**

|                                                 |                                           |
|-------------------------------------------------|-------------------------------------------|
| Lithium (Chassis) Grease (Refer to Appendix C). | Sleeve (M915), 188-4-VM (97706).          |
| Cotter Pin, 108656 (24617).                     | Sleeve (M916), S409-1SB (75535).          |
| GAA (Refer to Appendix C).                      | Cable (M915), 1/8 x 15/7 x 19 (75535).    |
| Cotter Pin, 773 (74410).                        | Cable (M916), 1/8 x 15 ft/7 x 19 (75535). |

FRAME.

11-13. FIFTH WHEEL MAINTENANCE.

THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)

- a. Removal. (15)
  - b. Lubrication. (10)
  - c. Adjustment. (10)
  - d. Installation. (25)
- 60 Minutes Total.

INITIAL SETUP

APPLICABLE CONFIGURATIONS

M915, M916, M920

TEST EQUIPMENT

None.

SPECIAL TOOLS

1,000 Lb Hoist.  
Lift Hook.  
M916 and M920 Fifth Wheel Adjustment  
Tool (CT447ALX2).

MATERIALS/PARTS (P/N)

GAA (Refer to Appendix C).

EQUIPMENT CONDITION

PARAGRAPH

None.

CONDITION DESCRIPTION

None.

PERSONNEL REQUIRED

One (MOS-63B20).

SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Parked on Level Ground.

## LOCATION/ITEM

## ACTION

## REMARKS

## CAUTION

This procedure tells you how to remove and install the passenger heat control knob and cable. Follow the same steps to replace controls for driver heat, fresh vent, recirculation vent, and heater. Be sure to secure a new cable tie around cables after task completion to prevent contact and possible electrical short against air pressure warning switch located on the firewall.

BODY AND CAB.

11-30. HEATER AIR DUCTS MAINTENANCE (Continued).

| LOCATION/ITEM                | ACTION          | REMARKS |
|------------------------------|-----------------|---------|
| <b>A. REMOVAL.</b>           |                 |         |
| 1. Clamps (2), (3), and (4). | Loosen.         |         |
| 2. Three hose ties (7)       | Cut and remove. |         |
| 3. Air ducts (1) and (8).    | Remove.         |         |

The diagram is an exploded view of a heater air duct assembly. It shows a main rectangular unit with a circular fan grille on the front. Various components are shown in their relative positions as they would be assembled. Numbered callouts point to specific parts: 1 points to an air duct fitting on top; 2 points to a clamp on a hose; 3 points to another clamp; 4 points to a third clamp; 5 points to a bracket on the side; 6 points to a screw; 7 points to a hose tie; and 8 points to another air duct fitting. The diagram illustrates the removal process for these components.

REMOVAL (Continued).</b>                                                                                                                                                          |                                                                                                                                                                                                              |                                                                                                                     |
| 5. One bolt (3), one nut (6), and the roller mounting bracket (5).                                                                                                                      | Remove.                                                                                                                                                                                                      |                                                                                                                     |
| 6. Roller mounting bracket (5) and tail roller (2).                                                                                                                                     | Pull tail roller's axle shaft out of roller mounting bracket.                                                                                                                                                |                                                                                                                     |
| 7. Four washer base nuts (1) and washer base bolts (7).                                                                                                                                 | Unscrew and remove second roller mounting bracket (4).                                                                                                                                                       | Removal is necessary only if replacement is needed due to wear or damage.                                           |
| <p style="text-align: center;"><b>NOTE</b></p> <p style="text-align: center;">If bearings inside tail roller or axle shaft are to be serviced, refer to Direct Support Maintenance.</p> |                                                                                                                                                                                                              |                                                                                                                     |
| <b>B. INSTALLATION.</b>                                                                                                                                                                 |                                                                                                                                                                                                              |                                                                                                                     |
| 8. One roller mounting bracket (5).                                                                                                                                                     | Aline with holes in frame rail (8) and install with four washer base bolts (7) and washer base nuts (1).                                                                                                     | Make sure you use correct holes in roller mounting bracket. M916 uses two top rows; M920 uses bottom two rows.      |
| 9. Second roller mounting bracket (5).                                                                                                                                                  | Slide over axle shaft of tail roller (2) and secure with bolt (3) and nut (6).                                                                                                                               |                                                                                                                     |
| 10. Tail roller (2) with assembled roller mounting bracket (5).                                                                                                                         | a. Lift into position with hoist and aline mounting holes with those in frame rails (8) and tail roller axle into first roller mounting bracket already installed.<br>b. Block in position with axle stands. | First mechanic operates hoist while second guides assembly.                                                         |
| 11. Four washer base bolts (7) and washer base nuts (1).                                                                                                                                | Install thru second roller mounting bracket (5) and frame rail (8).                                                                                                                                          | Make sure you use correct bolt holes in roller mounting bracket. M916 uses two top rows; M920 uses bottom two rows. |

## BODY AND CAB.

## 11-33. TAIL ROLLER MAINTENANCE (Continued).

| LOCATION/ITEM | ACTION | REMARKS |
|---------------|--------|---------|
|---------------|--------|---------|

**B. INSTALLATION (Continued).**

- |                                   |                                                                       |                                                                  |
|-----------------------------------|-----------------------------------------------------------------------|------------------------------------------------------------------|
| 12. Two lubrication fittings (4). | Clean, inspect and lubricate using grease gun (see LO 9-2320-273-12). | Refer to Direct Support Maintenance if replacement is necessary. |
|-----------------------------------|-----------------------------------------------------------------------|------------------------------------------------------------------|

Follow-on maintenance action required:

- a. Install blackout tail lamps (para 5-50B).
- b. Install tow eyes (para 11-9B).
- c. Install mud flaps (para 11-19B).

## CHAPTER 12

### WINCH AND PTO LINKAGE MAINTENANCE

---

#### **12-1. OVERVIEW.**

This chapter provides you with the following information related to winch and power takeoff maintenance:

- a. All required special tools and equipment.
- b. Other technical manuals.
- c. Troubleshooting procedures.
- d. Maintenance procedures.

---

#### **Section I REPAIR PARTS, SPECIAL TOOLS, TMDE AND SUPPORT EQUIPMENT**

---

#### **12-2. COMMON TOOLS AND EQUIPMENT.**

For authorized common tools and equipment, refer to the Modified Table of Organization and Equipment (MTOE) applicable to your unit.

#### **12-3. SPECIAL TOOLS, TMDE, SUPPORT EQUIPMENT.**

The special tools, TMDE and support equipment required for the winch and power takeoff maintenance procedures described in this chapter are limited to the oil filter strap wrench. (Refer to Organizational Maintenance RPSTL, TM 9-2320-273-20P for tool description and illustration.)

#### **12-4. SPARES AND REPAIR PARTS.**

Spares and repair parts are listed and illustrated in the Repair Parts and Special Tools List covering Organizational Maintenance for this equipment (TM 9-2320-273-20P).

---

#### **Section II TROUBLESHOOTING**

---

#### **12-5. INTRODUCTION.**

Tables 12-1 and 12-2 contain instructions for troubleshooting the winch and the power takeoff, which are driven by the transmission. The corrective actions tell you how to fix the

---

### **12-5. INTRODUCTION (Continued).**

problem or refer you to a procedure that will fix the problem. The Troubleshooting tables are arranged by malfunctions in the following order:

WINCH (M916 and M920) (Table 12-1)

- a. Winch operates in one direction only.
- b. Winch does not operate in either direction.
- c. Winch operates at one speed only.
- d. Winch will not hold suspended load.

POWER TAKEOFF (PTO) (M916 thru M920) (Table 12-2).

- a. PTO will not engage.
- b. PTO is excessively noisy.

---

## **Section III MAINTENANCE PROCEDURES**

---

---

### **12-6. INTRODUCTION.**

This section provides you with Organizational Level maintenance procedures for the winch. The scope of maintenance is limited to the work listed in the following summary of task procedures.

Table 12-1. Winch Troubleshooting Procedures.

| MALFUNCTION.                                                                                                               |                                                                                                      |
|----------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------|
| TEST OR INSPECTION.                                                                                                        |                                                                                                      |
| CORRECTIVE ACTION.                                                                                                         |                                                                                                      |
| 1. WINCH OPERATES IN ONE DIRECTION ONLY:                                                                                   |                                                                                                      |
| Step 1. Inspect all oil lines for damage and leakage.                                                                      | Replace lines (para 12-13).                                                                          |
| Step 2. Inspect directional control valve for leakage.                                                                     | Tighten connections or replace valve (para 12-11).                                                   |
| Step 3. Check winch motor for leakage and visible signs of overheating.                                                    | Replace winch motor (para 12-14).                                                                    |
| Step 4. Check to see if pilot orifice in winch brake valve is plugged.                                                     | Clean orifice.                                                                                       |
| 2. WINCH DOES NOT OPERATE IN EITHER DIRECTION:                                                                             |                                                                                                      |
| Step 1. Check all oil lines for damage and leakage.                                                                        | Tighten loose connections and replace defective components.                                          |
| Step 2. Check pump inlet strainer and in line filter for clogging.                                                         | Replace filter element (para 12-9 and 12-10).                                                        |
| Step 3. Check reservoir for proper oil level.                                                                              | Fill to proper level (LO 9-2320-273-12).                                                             |
| Step 4. Check pump for leakage and visible signs of overheating.                                                           | Replace pump (para 12-15).                                                                           |
| Step 5. Connect a pressure gage in line between each control valve and winch motor (one at a time) and attempt to operate. | If pressure is normal (2350 psi maximum), refer winch to Direct Support Maintenance for replacement. |

Table 12-1. Winch Troubleshooting Procedures (Continued).

| MALFUNCTION.                           |                                                                    |
|----------------------------------------|--------------------------------------------------------------------|
| TEST OR INSPECTION.                    |                                                                    |
| CORRECTIVE ACTION.                     |                                                                    |
| 3. WINCH OPERATES AT ONE SPEED ONLY:   |                                                                    |
|                                        | Check the auxiliary control valve for damage and leakage.          |
|                                        | a. Tighten or repair leaking connections or lines.                 |
|                                        | b. Replace valve (para 12-11).                                     |
|                                        | c. Check rear gear section of dual pump (refer to Direct Support). |
| 4. WINCH WILL NOT HOLD SUSPENDED LOAD: |                                                                    |
| Step 1.                                | Check failsafe brake disk to see if it is oil soaked.              |
|                                        | Replace brake assembly.                                            |
| Step 2.                                | Check failsafe brake disks for wear.                               |
|                                        | Replace brake.                                                     |

## 2-8. WINCH CABLE MAINTENANCE.

**THIS TASK COVERS: (APPROXIMATE TIME REQUIRED FOLLOWS TASK DESCRIPTION.)**

- |                  |                   |
|------------------|-------------------|
| a. Removal.      | (15)              |
| b. Installation. | <u>(20)</u>       |
|                  | 35 Minutes Total. |

## INITIAL SETUP

## APPLICABLE CONFIGURATIONS

M916 and M920.

## TEST EQUIPMENT

None.

## SPECIAL TOOLS

None.

### MATERIALS/PARTS (P/N)

None.

EQUIPMENT CONDITION  
PARAGRAPH

None.

### CONDITION DESCRIPTION

None.

## PERSONNEL REQUIRED

Two (MOS-63B20) .

## SPECIAL ENVIRONMENTAL CONDITIONS

Vehicle Park ad on Level Ground.

## REFERENCES (TM)

## APPENDIX B MAINTENANCE ALLOCATION CHART

---

### Section I. INTRODUCTION

#### THE ARMY MAINTENANCE SYSTEM (AMS)

This introduction provides a general explanation of all maintenance and repair functions authorized at the two maintenance levels under the Two-Level Maintenance System concept.

The MAC (immediately following the introduction) designates overall authority and responsibility for the performance of maintenance functions on the identified end item or component. The application of the maintenance functions to the end item or component shall be consistent with the capacities and capabilities of the designated maintenance levels, which are shown on the MAC in column 4 as:

Field - includes two subcolumns, Unit C (operator/crew) and O (unit/organizational maintenance) and Direct Support (F) maintenance

Sustainment - includes two subcolumns, general support (H) and depot (D).

The tools and test equipment requirements (immediately following the MAC) list the tools and test equipment (both special tools and common tool sets) required for each maintenance function as referenced from the MAC.

The remarks (immediately following the tools and test equipment requirements) contain supplemental instructions and explanatory notes for a particular maintenance function.

#### MAINTENANCE FUNCTIONS

Maintenance functions are limited to and defined as follows:

1. Inspect. To determine the serviceability of an item by comparing its physical, mechanical, and/or electrical characteristics with established standards through examination (e.g., by sight, sound, or feel).
2. Test. To verify serviceability by measuring the mechanical, pneumatic, hydraulic, or electrical characteristics of an item and comparing those characteristics with prescribed standards on a scheduled basis, i.e., load testing of lift devices and hydrostatic testing of pressure hoses.
3. Service. Operations required periodically to keep an item in proper operating condition: e.g., to clean (includes decontaminate, when required), to preserve, to drain, to paint, or to replenish fuel, lubricants, chemical fluids, or gases.
4. Adjust. To maintain or regulate, within prescribed limits, by bringing into proper position, or by setting the operating characteristics to specified parameters.
5. Align. To adjust specified variable elements of an item to bring about optimum or desired performance.

**MAINTENANCE FUNCTIONS - Continued**

6. **Calibrate.** To determine and cause corrections to be made or to be adjusted on instruments of test, measuring, and diagnostic equipment used in precision measurement. Consists of comparisons of two instruments, one of which is a certified standard of known accuracy, to detect and adjust any discrepancy in the accuracy of the instrument being compared.
7. **Remove/Install.** To remove and install the same item when required to perform service or other maintenance functions. Install may be the act of emplacing, seating, or fixing into position a spare, repair part, or module (component or assembly) in a manner to allow the proper functioning of an equipment or system.
8. **Replace.** To remove an unserviceable item and install a serviceable counterpart in its place. "Replace" is authorized by the MAC and assigned maintenance level is shown as the third position code of the Source, Maintenance and Recoverability (SMR) code.

**NOTE**

The following definitions are applicable to the "repair" maintenance function:

**Services.** Inspect, test, service, adjust, align, calibrate, and/or replace.

**Fault location/troubleshooting.** The process of investigating and detecting the cause of equipment malfunctioning: the act of isolating a fault within a system or Unit Under Test (UUT).

**Disassembly/assembly.** The step-by-step breakdown (taking apart) of a spare/functional group coded item to the level of its least component, that is assigned an SMR code for the level of maintenance under consideration (i.e., identified as maintenance significant).

**Actions.** Welding, grinding, riveting, straightening, facing, machining, and/or resurfacing.

9. **Repair.** The application of maintenance services, including fault location/troubleshooting, removal/installation, disassembly/assembly procedures, and maintenance actions to identify troubles and restore serviceability to an item by correcting specific damage, fault, malfunction, or failure in a part, subassembly, module (component or assembly), end item, or system.
10. **Overhaul.** That maintenance effort (service/action) prescribed to restore an item to a completely serviceable/operational condition as required by maintenance standards in appropriate technical publications. Overhaul is normally the highest degree of maintenance performed by the Army. Overhaul does not normally return an item to like new condition.
11. **Rebuild.** Consists of those services/actions necessary for the restoration of unserviceable equipment to a like new condition in accordance with original manufacturing standards. Rebuild is the highest degree of material maintenance applied to Army equipment. The rebuild operation includes the act of returning to zero those age measurements (e.g., hours/miles) considered in classifying Army equipment/components.

**EXPLANATION OF COLUMNS IN THE MAC**

**Column 1, Group Number.** Column 1 lists FGC numbers, the purpose of which is to identify maintenance significant components, assemblies, subassemblies, and modules with the Next Higher Assembly (NHA).

**Column 2, Component/Assembly.** Column 2 contains the item names of components, assemblies, subassemblies, and modules for which maintenance is authorized.

**Column 3, Maintenance Function.** Column 3 lists the functions to be performed on the item listed in Column 2. (For a detailed explanation of these functions, refer to "Maintenance Functions" outlined above.)

**EXPLANATION OF COLUMNS IN THE MAC - Continued**

**Column 4, Maintenance Level.** Column 4 specifies each level of maintenance authorized to perform each function listed in Column 3, by indicating work time required (expressed as manhours in whole hours or decimals) in the appropriate subcolumn. This work time figure represents the active time required to perform that maintenance function at the indicated level of maintenance. If the number or complexity of the tasks within the listed maintenance function varies at different maintenance levels, appropriate work time figures are to be shown for each level. The work time figure represents the average time required to restore an item (assembly, subassembly, component, module, end item, or system) to a serviceable condition under typical field operating conditions. This time includes preparation time (including any necessary disassembly/assembly time), troubleshooting/fault location time, and quality assurance time in addition to the time required to perform the specific tasks identified for the maintenance functions authorized in the MAC. The symbol designations for the various maintenance levels are as follows:

**Field:**

C Operator or crew maintenance  
 O Unit maintenance  
 F Direct support maintenance

**Sustainment:**

H General support maintenance  
 D Depot maintenance

**NOTE**

The "L" maintenance level is not included in Column 4 of the MAC. Functions to this level of maintenance are identified by a work time figure in the "H" column of Column 4, and an associated reference code is used in the REMARKS Column 6. This code is keyed to the remarks and the SRA complete repair application is explained there.

**Column 5, Tools and Equipment Reference Code.** Column 5 specifies, by code, those common tool sets (not individual tools), common Test, Measurement and Diagnostic Equipment (TMDE), and special tools, special TMDE and special support equipment required to perform the designated function. Codes are keyed to the entries in the tools and test equipment table.

**Column 6, Remarks Code.** When applicable, this column contains a letter code, in alphabetical order, which is keyed to the remarks table entries.

## EXPLANATION OF COLUMNS IN THE TOOLS AND TEST EQUIPMENT REQUIREMENTS

**Column 1, Tool or Test Equipment Reference Code.** The tool or test equipment reference code correlates with a code used in Column 5 of the MAC.

**Column 2, Maintenance Level.** The lowest level of maintenance authorized to use the tool or test equipment.

**Column 3, Nomenclature.** Name or identification of the tool or test equipment.

**Column 4, National Stock Number (NSN).** The NSN of the tool or test equipment.

**Column 5, Tool Number.** The manufacturer's part number, model number, or type number.

### Explanation of Columns in the Remarks

**Column 1, Remarks Code.** The code recorded in Column 6 of the MAC.

**Column 2, Remarks.** This column lists information pertinent to the maintenance function being performed as indicated in the MAC.

## APPENDIX C

### EXPENDABLE SUPPLIES AND MATERIALS LIST

---

#### Section I INTRODUCTION.

---

##### **C-1. SCOPE.**

This appendix lists expendable supplies and materials you will need to operate and maintain the M915, M916, M920 Truck Tractors and Chassis for M917, M918, and M919.

These items are authorized to you by CTA 50-970, Expendable Items (Except Medical, Class V, Repair Parts, and Heraldic Items).

##### **C-2. EXPLANATION OF COLUMNS.**

*a. Column 1 – Item Number.* This number is assigned to the entry in the listing and is referenced in the narrative instructions to identify the material (e.g., “Use cleaning compound, item 5, App. D”).

*b. Column 2 – Level.* This column identifies the lowest level of maintenance that requires the listed item.

C – Operator/Crew.

O – Organizational Maintenance.

F – Direct Support Maintenance.

H – General Support Maintenance.

*c. Column 3 – National Stock Number.* This is the National stock number assigned to the item; use it to request or requisition the item.

*d. Column 4 – Description.* Indicates the Federal item name and, if required, a description to identify the item. The last line for each item indicates the part number followed by the Federal Supply Code for Manufacturer (BSCM) in parentheses, if applicable.

*e. Column 5 – Unit of Measure (U/M).* Indicates the measure used in performing the actual maintenance function. This measure is expressed by a two-character alphabetical abbreviation (e.g., ea, in, pr). If the unit of measure differs from the unit of issue, requisition the lowest unit of issue that will satisfy your requirements.

## APPENDIX E

## ILLUSTRATED LIST OF MANUFACTURED ITEMS

## Section I INTRODUCTION.

**E-1. GENERAL.**

a. This appendix includes complete instructions for making items authorized to be manufactured or fabricated at organizational level.

b. A part number index in alphanumeric order is provided for cross-referencing the part number of the item to be manufactured to the figure which covers fabrication criteria.

c. All bulk materials needed for manufacture of an item are listed by part number or specification number in a tabular list on the illustration.

**E-2. MANUFACTURED ITEM PART NUMBER INDEX.**

| PART NO.    | FIGURE NO. | PART NO.    | FIGURE NO. | PART NO.    | FIGURE NO. |

**Figure E-1. 1/4" (6.35mm) O.D. Nonmetallic Tubing and Fittings,  
Fabricate Tube From NSN 4720-01-058-7213**

## INSTRUCTIONS:

1. Determine tube part number needed from RPSTL and cut squarely to correct length as shown above.
2. Select proper end fittings based upon tube part number.
3. Insert tube into fitting and tighten nut with wrench until one thread remains visible on the fitting body.

THE METRIC SYSTEM AND EQUIVALENTSLINEAR MEASURE

1 Centimeter = 10 Millimeters = 0.01 Meters = 0.3937 Inches  
 1 Meter = 100 Centimeters = 1000 Millimeters = 39.37 Inches  
 1 Kilometer = 1000 Meters = 0.621 Miles

WEIGHTS

1 Gram = 0.001 Kilograms = 1000 Milligrams = 0.035 Ounces  
 1 Kilogram = 1000 Grams = 2.2 Lb  
 1 Metric Ton = 1000 Kilograms = 1 Megagram = 1.1 Short Tons

LIQUID MEASURE

1 Milliliter = 0.001 Liters = 0.0338 Fluid Ounces  
 1 Liter = 1000 Milliliters = 33.82 Fluid Ounces

SQUARE MEASURE

1 Sq Centimeter = 100 Sq Millimeters = 0.155 Sq Inches  
 1 Sq Meter = 10,000 Sq Centimeters = 10.76 Sq Feet  
 1 Sq Kilometer = 1,000,000 Sq Meters = 0.386 Sq Miles

CUBIC MEASURE

1 Cu Centimeter = 1000 Cu Millimeters = 0.06 Cu Inches  
 1 Cu Meter = 1,000,000 Cu Centimeters = 35.31 Cu Feet

TEMPERATURE

$5 \text{ } ^\circ\text{F} - 32 = ^\circ\text{C}$   
 $212^\circ\text{ Fahrenheit is equivalent to } 100^\circ\text{ Celsius}$   
 $90^\circ\text{ Fahrenheit is equivalent to } 32^\circ\text{ Celsius}$   
 $32^\circ\text{ Fahrenheit is equivalent to } 0^\circ\text{ Celsius}$   
 $9 \text{ } ^\circ\text{C} + 32 = ^\circ\text{F}$
